PRINTING HISTORY

New editions of this manual will incorporate all material since the previous editions. Update packages may be used between editions which contain replacement and additional pages to be merged into the manual by the user.

The manual printing date indicates its current edition. The printing date changes when a new edition is printed.

Preliminary Release - August 1986
Revision 1 - March 1987
Revision 2 - September 1987
August 1990

PREOPERATION

1. Work through the SETUP execute list (**SETUP**, or **FCT 40**), which covers the following:
   - Page parameters
   - Operating parameters
   - Set the clock
   - Quantum sensor cal constant
   - CO_2 analyzer cal list
   - Flowmeter cal list
   - RH sensor cal list
   - Set analyzer reference

2. Check each sensor to make sure it is responding as expected:
   - Quantum sensor
   - Air and leaf temp matched?
   - IRGA temp
   - Flowmeter
   - CO_2 concentration
   - Relative humidity

3. Set the ZERO and SPAN for the CO_2 analyzer.

4. ZERO the flowmeter (**FCT 48**).

5. Check the humidity sensor against a standard you can trust.

6. Check system for leaks.

7. Desiccant test (K Test).

REMINDERS

EVERY 10 -15 MINUTES...
- Shake the desiccant tube

EVERY 30 - 60 MINUTES...
- Zero the flowmeter
- Check the CO_2 analyzer zero
- Test the desiccant (K Test)

EVERY DAY...
- Preoperation procedure
- Clean chambers
- LI-6250 fan filter
- Re-charge used batteries

EVERY FEW WEEKS...
- Check soda lime
- LI-6250 filter #2

EVERY YEAR...
- LI-6250 filter #3
- LI-6250 internal soda/desiccant

OR

- Return to factory for complete recalibration

CONVERSIONS

Photosynthesis
$\mu mol\ m^{-2}\ s^{-1} \times 0.044 = mg\ m^{-2}\ s^{-1}$
$\mu mol\ m^{-2}\ s^{-1} \times 1.584 = mg\ dm^{-2}\ hr^{-1}$
$mg\ m^{-2}\ s^{-1} \times 36 = mg\ dm^{-2}\ hr^{-1}$

Transpiration
$mol\ m^{-2}\ s^{-1} \times 18{,}000 = mg\ m^{-2}\ s^{-1}$
$mol\ m^{-2}\ s^{-1} \times 44{,}100 = W\ m^{-2}$

Conductance
$mol\ m^{-2}\ s^{-1} \times 2.5 = cm\ s^{-1}$

Pressure
mm Hg × 1.333 = millibar
kPa × 10 = millibar

TROUBLESHOOTING

Conductance Too Low

- Humidity reading too low.
- Flowmeter reading too low. (Re-zero?)
- Leaf area too high.
- Volume too low (if not steady state conditions).
- Bad contact between leaf thermocouple and leaf, with $T_{leaf} < T_{air}$.
- Did humidity rise during the measurement? Use a higher flow rate if possible.

Conductance Too High or Negative

- Humidity reading too high.
- Flowmeter reading too high. (Re-zero?)
- Desiccant not adequate.
- Volume too high (if not steady state conditions).
- Leaf area too low. If it is low enough to make the leaf resistance come out smaller than the boundary layer resistance, then the stomatal resistance (and conductance) will be negative.
- Bad contact between leaf thermocouple and leaf, with $T_{leaf} > T_{air}$.
- Did humidity fall during the measurement? Use a lower flow rate.

TROUBLESHOOTING, Cont'd

Photosynthesis Too Low (High)

- CO_2 analyzer calibrated correctly? Are you sure of your span gas?
- Volume too low (high).
- Leaf area too high (low).
- Pressure parameter too low (high).

Intercellular CO_2 Too Low (High)

- Photosynthesis too high (low).
- Stomatal conductance too low (high).
