## FEATURES

- **Two models of VMEbus-based boards**  
**DVME-611: 32 single-ended/16 differential A/D channels**  
**DVME-612: 32 single-ended/16 differential A/D channels and 2 D/A channels**
- **Choice of A/D bits/speed**  
 12 bits/2, 4, or 20  $\mu$ Sec.  
 14 bits/4  $\mu$ Sec.  
 16 bits/35  $\mu$ Sec.
- **Four input voltage ranges available:  $\pm 10V$ ,  $\pm 5V$ , 0 to  $+5V$ , and 0 to  $+10V$  dc**
- **Three types of output coding:**  
 Bipolar 2's complement  
 Bipolar offset binary  
 Unipolar straight binary
- **Up to 400 KHz throughput with a *fast throughput mode* for high-speed data transfers (single channel)**
- **On-board interrupt vector register for host system's service routines**
- **80 dB CMRR at gain of 128**
- **Two TTL digital outputs**

- **Eight-stage programmable gain amplifier (PGA)**
- **$\pm 0.05\%$  full-scale range accuracy for D/A channels**
- **Channel expansion boards for up to 256 channels**  
**DVME-641: Non-isolated, high-level inputs**  
**DVME-643: Isolated, thermocouple, RTD, high-level, 4-to-20 mA inputs**  
**DVME-645: Simultaneous sample/hold inputs**

## GENERAL DESCRIPTION

The DVME-611/612 are DATEL's VMEbus based high-end A/D conversion boards. The A/D conversion boards provide up to 16-bit binary data from up to 32 single-ended or 16 differential analog input channels. DATEL also offers optional expansion boards for up to 256 single-ended or differential analog input channels. The DVME-612 is also equipped with two D/A channels, operable in four output voltage ranges.

The on-board hardware essentially consists of multiplexers, a PGA, an A/D converter, and registers. The PGA is programmable for gains from 1 to 128 in binary increments. Both the DVME-611 and the DVME-612 are available in several models depending upon the A/D converter module used. The A/D converter modules are easily field-replaceable. All models except the DVME-611D and the DVME-612D contain a sample/hold amplifier.

The host-programmable command register controls the A/D conversion process. Depending upon the contents of the command register, an external trigger may also initiate the A/D conversion process. The host system may obtain information pertaining to the A/D conversion and control selections by reading the status register.

The channel and control information from the channel select logic section is brought out to the J4 expansion connector. The control lines include End of Conversion (EOC), End of Scan (EOS), settling time delay, and external trigger signals. These control signals on the expansion connector are also usable with externally multiplexed input channels. The host system selects the start and final channels for the A/D scanning process.

The analog output section on the DVME-612 offers  $\pm 1/2$  LSB differential non-linearity and operates at  $\pm 0.05\%$  of full-scale range accuracy.

Functionally, the analog signal from the input channel is amplified and converted into binary data. The resolution depends on the A/D converter module used. Figure 1 is a functional block diagram of the DVME-611/612 A/D boards. Data from the A/D converter module is coded via jumpers into straight binary, offset binary, or 2's complement coding. The binary A/D data is transferred to the host system through the VMEbus transceivers.

The DVME-611/612 A/D boards can operate in a *fast throughput mode* for applications requiring fast data transfers. This mode is selectable using the command register. The *fast throughput mode* guarantees transfer of A/D data on to the VMEbus without having to test the conversion status. When A/D data is read, this mode delays the host CPU DTACK\* while EOC = 0.

The DVME-611/612 A/D boards come with a user's manual. The user's manual describes the installation and calibration procedures for different applications and explains the theory of operation of the A/D boards. The user's manual also contains information on troubleshooting the boards

The boards are shipped with a 5.25 inch MS-DOS disk containing an example source program. Consult the factory regarding the availability of the diagnostic program's source code in other disk formats.

**VME Interface**

The DVME-611/612 interfaces to the host system using the P1 connector. The board uses short I/O space address lines and 16 data lines. On-board switches select the base address of the board. The board responds to address modifier codes 29H, 2DH, 39H, and 3DH for data output purposes.

The DVME-611/612 generates the data acknowledge (DTACK\*) signal to notify acceptance of data from the VME data lines, D00 through D15. The DTACK\* signal is jumper-selectable for delay times from 125 nanoseconds to 1000 nanoseconds, accommodating different host systems.

The interface logic decodes VMEbus control lines (WRITE\*, DS0\*, DS1\*, and AS\*) to provide the interface control signals. These signals control the board select and the VMEbus transfer functions. The DVME-611/612 uses programmable array logic (PAL) devices for interface and control, guaranteeing true asynchronous operation.

**VMEbus Interrupt Logic**

The interrupt logic section senses an EOC or EOS condition and generates an interrupt request on one of the VMEbus interrupt lines (IRQ1\* through IRQ7\*). The interrupt lines are jumper-selectable. The interrupt logic accepts IACK\* and IACKIN\* signals from the host system as interrupt acknowledge and daisy chain input signals. Depending upon the interrupt level, the on-board logic loads the interrupt ID number on to the VMEbus or generates the daisy chain IACKOUT\* signal.

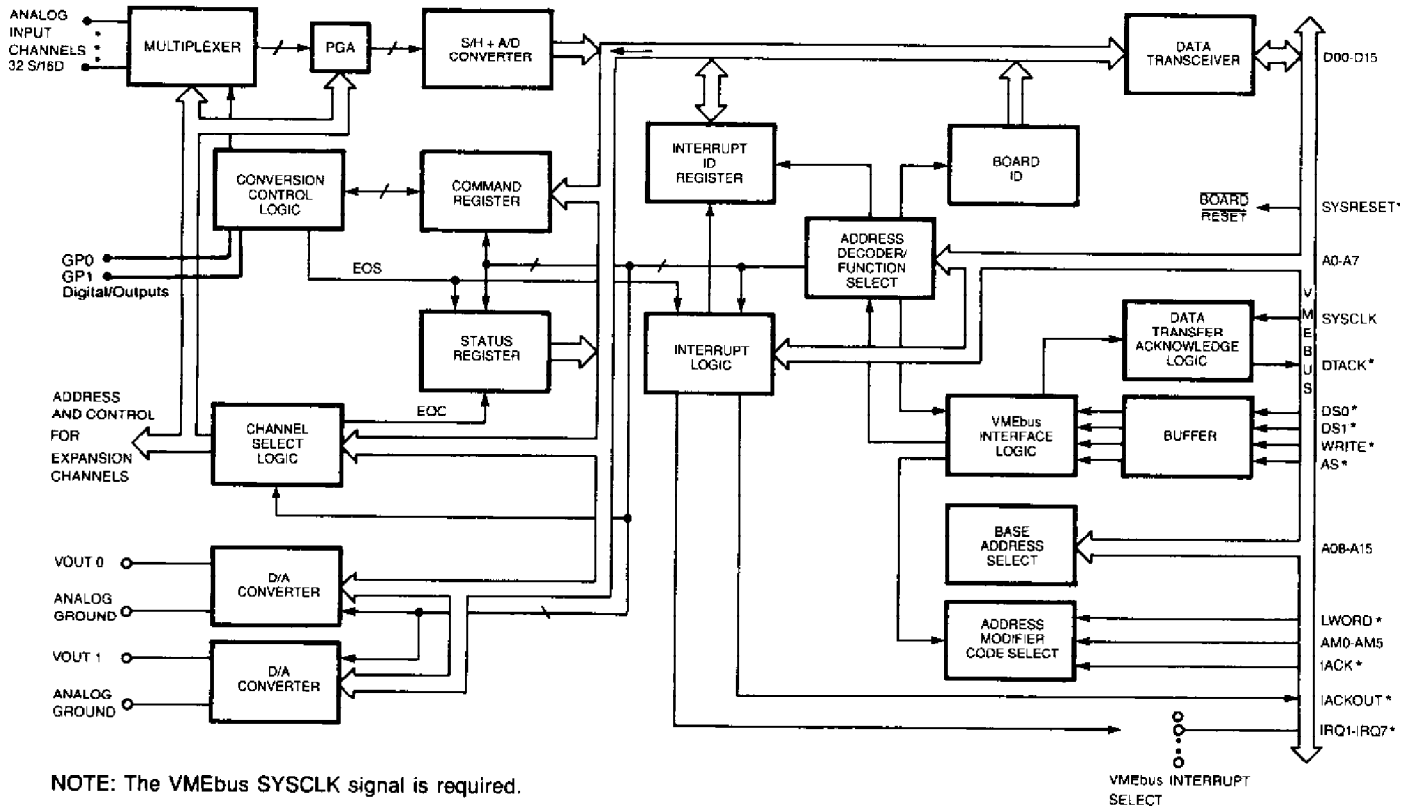

Figure 1. DVME-611/612 Functional Block Diagram

**FUNCTIONAL SPECIFICATIONS**

(Typical at 25 °C, unless otherwise noted)

**VMEbus INTERFACE**

**Data Bus** ..... 16 Bits. (A16:D16 slave)  
**Address Bus** ..... Short I/O Space 16 address lines  
**Address Modifier Codes**.. Codes used 29H, 2DH, 39H, and 3DH  
**Interrupts** ..... 1 line, jumper-selectable  
 2 interrupt ID's for EOC and EOS  
 Software programmable  
**Memory Mapping** ..... Short I/O space, user or supervisor-  
 or 256 words allocated per board  
**Data Transfer**..... DTACK\* signal line  
 Acknowledges the VMEbus host  
 that data has been placed or ac-  
 cepted from the VMEbus data  
 lines

**ANALOG INPUT**

**Number of Channels**..... 32 single-ended or 16 differential  
**Channel Expansion**..... 256 single-ended or differential;  
 requires external multiplexing.  
 Use DATEL's DVME-641,  
 DVME-643, or DVME-645 mux  
 boards.  
**Input Configuration**..... Single-ended or differential  
**Input Ranges** ..... ±10V, ±5V, 0 to +5V, or  
 0 to +10V, jumper-selectable.  
 See Table 2.

**Digital Outputs**

**Standard** ..... Offset binary  
**Jumperable** ..... Straight binary or 2's complement  
**External Start Trigger** ..... TTL compatible, negative going  
 edge.  
 Minimum pulse width = 100 nS  
 Maximum pulse width = 2 µS  
**Common Mode Voltage**... ±10V dc, maximum, non-isolated  
**Input Bias Current**..... 8 nA, maximum  
**Over Voltage Protection**.. ±35V dc, maximum  
**Input Impedance**  
**Differential to ground** ..... 10 megohms, minimum

**PERFORMANCE**

**Programmable Gain**..... Uses an AM-543MC for gains of  
 X1, X2, X4, X8, X16, X32, X64,  
 X128

**Common Mode Rejection**  
**for ±10V input signal**  
**at 60 Hz, minimum** ..... 75 dB at a gain of 2  
 80 dB at a gain of 128

**Full-Scale Range Accuracy, minimum**

**DVME-611A/612A**..... 0.025% at a gain of 1  
**DVME-611E/612E** ..... 0.20% at a gain of 128  
**DVME-611B/612B**..... 0.05% at a gain of 1  
 0.20% at a gain of 128  
**DVME-611C/612C**..... 0.010% at a gain of 1  
 0.20% at a gain of 128  
**DVME-611D/612D**..... 0.0063% at a gain of 1  
 0.20% at a gain of 128  
**DVME-611F/612F** ..... 0.01% at a gain of 1

**PGA plus MUX Settling**

**Time, maximum**..... 8 µS at a gain of 1  
 12 µS at a gain of 16  
 40 µS at a gain of 64  
 100 µS at a gain of 128

**Min. conversion time**

**DVME-611A/612A**..... 20 µS at a gain of 1  
 110 µS at a gain of 128  
**DVME-611B,E/612B,E**... 8 µS at a gain of 1  
 102 µS at a gain of 128  
**DVME-611C/612C**..... 35 µS at a gain of 1  
 110 µS at a gain of 128  
**DVME-611D/612D**..... 400 mS at a gain of 1  
 400 mS at a gain of 128  
**DVME-611F/612F** ..... 4 µS at gain = 1

Note: Allow 20 minutes warm-up for DVME-611F/612F

**Resolution and Throughput**

(Scan Mode)	Resolution in bits	Conversion time	Throughput conversions /sec.*
DVME-611A/612A	12	20 µS	40,320
DVME-611B/612B	12	4 µS	160,000
DVME-611C/612C	16	35 µS	18,667
DVME-611D/612D	16	400 mS	2.5
DVME-611E/612E	12	2 µS	see notes
DVME-611F/612F	14	4 µS	100,000

\*Typical sample rate per channel in scan mode.

**Temperature Drift and Linearity**

Model	Gain Temperature Coefficient (ppm/ °C)	Zero Temperature Drift, (ppm/ °C)	Linearity Error
DVME-611A/612A	±20	20	1/2 LSB
DVME-611B/612B	±20	20	1/2 LSB
DVME-611C/612C	±20	20	2 LSB
DVME-611D/612D	±10	10	2 LSB
DVME-611E/612E	±20	±20	1/2 LSB
DVME-611F/612F	±15	±15	2 LSB

**Optional Multiplexer Expansion Boards**

Model	Number of expansion channels		Input type
	Single-ended	Differential	
DVME-641	32	16	High-level, non-isolated
DVME-643T	-	8	Thermocouple Isolated
DVME-643H	-	8	High-level Isolated
DVME-645	16	8	Simultaneous Sample/Hold high-level non-isolated

**ANALOG OUTPUT (For DVME-612 models only)**

**Number of Channels** .....2  
**Output Range**.....±10V, ±5V, 0 to +5V, or 0 to +10V  
**Digital Input Coding** .....Bipolar 2's complement, bipolar offset binary or unipolar straight binary  
**Resolution**.....12 Bits, bits D0 through D3 not used  
**Reset** .....Minus, full-scale, -10V for 2's complement and offset binary 0V for Unipolar  
**Full-Scale Range**  
**Accuracy** .....0.5%, minimum  
**Diff. Non-Linearity** .....0.5 LSB, minimum  
**Zero Temperature Drift**.....5 ppm/ °C, maximum  
**Offset Temperature Drift**...20 ppm/ °C, maximum  
**Gain Temperature Drift** ....20 ppm/ °C, maximum  
**Settling Time**.....10 µS, maximum  
**Output Current**.....5 milliamps, maximum  
**Output Impedance**.....50 milliohms, typical

**POWER SUPPLY REQUIREMENTS**

+5V dc ±5% at 2.5 Amperes  
 Note: On-board dc-to-dc converter generates ±15V dc for the DVME-611/612 logic circuits

**CONNECTORS**

**VMEbus P1 connector**.....96-pin male DIN connector  
**J1 and J2 Analog Input Connectors**.....25-pin D-type female connectors  
**J3 Analog Output Connector**.....9-pin D-type female connector  
**J4 Analog Expansion Connector**.....25-pin D-type female connector

**PHYSICAL-ENVIRONMENTAL**

**Outline Dimensions**.....9.19"W x 6.3"D x 0.6"H (233.5 x 160 x 15.24 mm)  
**Weight**.....1 lb. 0.5 oz. (467.8 grams)  
**Operating Temp. Range**...0 to +60 °C  
**Storage Temp. Range**.....-20 to +80 °C  
**Relative Humidity** .....0 to 90%, non-condensing

**DVME-611/612 Programming Information**

The DVME-611/612 A/D boards use ten registers for data acquisition and control purposes. Table 1 lists the DVME-611/612 registers and their base address offsets. These registers are addressable locations in the host system's address space.

Address	Function	Contents
Base + 0 through Base + 63	Read	Manufacturer's/Board's identification
Base + 128	Write	Command register (80h)
Base + 128	Read	Status register (80h)
Base + 130	Write	Interrupt ID register (82h)
Base + 132	Write	EOC/EOS F/F Reset (84h)
Base + 134	Write	Gain register (86h)
Base + 136	Write	Start channel register (88h)
Base + 136	Read	Current channel register
Base + 138	Write	Final channel register (8Ah)
Base + 140	Write	Start conversion register (8Ch)
Base + 140	Read	A/D data register
Base + 142	Read	Status register (8Eh)
Base + 160	Write	D/A channel 0 (A0h)
Base + 162	Write	D/A channel 1 (A2h)

**Table 1. DVME-611/612 Hardware Register Functions**

**Command Register**

The DVME-611/612 boards scan their selected channels under control of the 16-bit command register. Programming the command register selects the modes for starting conversion, calibration, and fast throughput. This register also enables the interrupt, channel address auto-increment, and channel re-scan capabilities. Figure 2 shows the command register format.

**Status Register**

The DVME-611/612 status register indicates conditions relating to conversion status, channel scanning information, and modes selected. Figure 3 shows the status register format.

**Total System Throughput**

Total sample-to-sample throughput rate depends on the A/D-S/H settling and conversion period and the user's software period. During the software interval, data is transferred to the host and the next A/D conversion is started. By combining fast throughput mode (DTACK\* EOC holdoff) with convert-on-read-data, throughput over 400 KHz may be achieved for gain = 1 in single channel mode for model DVME-611E. Data transfer and host memory pointer management may partially overlap A/D Conversion by using the convert-on-read mode.

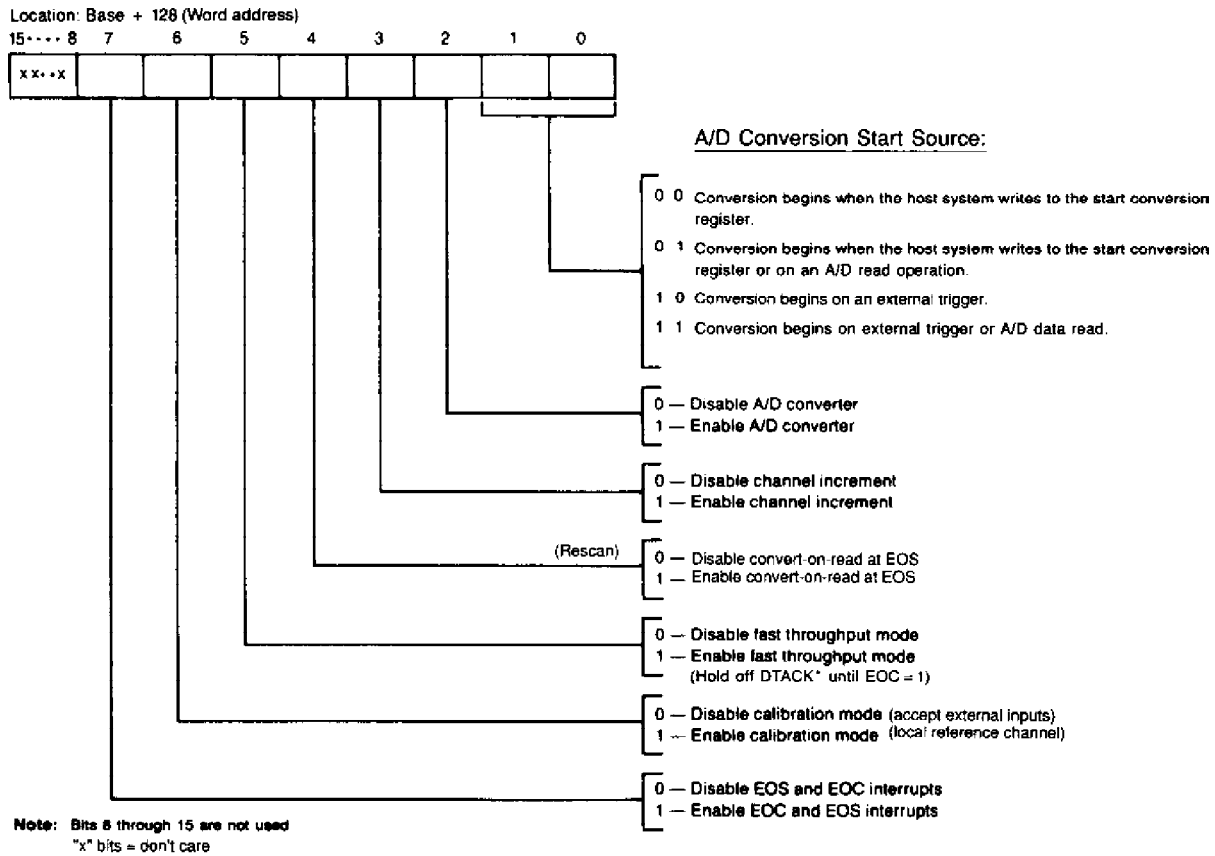

**Fast Throughput Mode**

This mode holds off response of the DTACK\* VMEbus signal with the simultaneous ANDing of three conditions: command register bit 5 = 1, EOC = 0, and a host read of the A/D data register. While DTACK\* is held off, the host CPU executes wait states. When A/D conversion finishes, EOC = 1 and DTACK\* is released. Normally the attempted A/D data read now completes, and data is transferred without any EOC polling. Fast throughput should be used with caution since the host must be completely dedicated to A/D data acquisition.

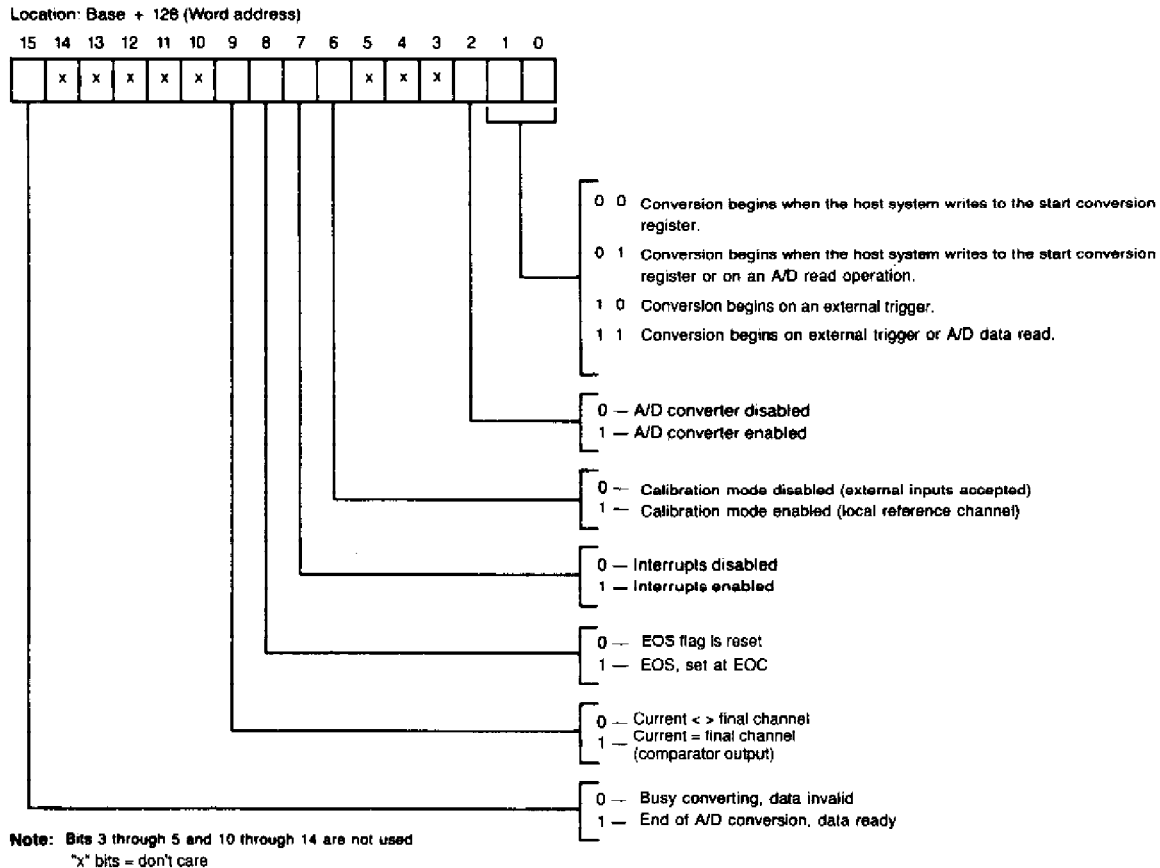

**Table 2. A/D Full Scale Input Ranges (PGA gain = 1)**

Input Range	Model				
	611/612A	611/612B,E	611/612C	611/612D	611/612F
0 to +5V	X	NA	NA	NA	NA
0 to +10V	X	X	NA	NA	S
±5V	X	NA	X	NA	S
±10V	X	X	X	X	X

X = supplied, NA = not available, S = solderable on module

**Figure 2: DVME-611/612 Command Register Format (WRITE)**

**Figure 3: DVME-611/612 Status Register Format (READ)**

**Interrupt ID Register**

This register contains the user-loaded interrupt ID number. On receiving the interrupt request, the host system tests the interrupt level using address lines A01 through A03. The host system must then acknowledge using the IACK\* and the daisy chain IACKIN\* signal lines. If the DVME-611/612 interrupt level matches the level code on the address lines, the interrupt logic loads the interrupt ID number on to the VMEbus (low byte). If the EOC/EOS interrupts and the multiple channel scan option are enabled, the board loads the ID number plus one on to the VMEbus data lines. The host system may use these ID's to differentiate the EOC and EOS interrupts. Figure 4 shows the register format of the interrupt ID register.

Figure 4: Interrupt ID Register Format

**Gain Register and Digital Outputs**

The least three significant bits of this register, when programmed, assign the gain to the differential amplifier in the PGA section. This register is programmable for gains from 1 to 128 in binary increments. Bits 6 and 7 of this register provide a general purpose digital output. The output signal lines from these two bits are available on pins 18 and 6 of the J4 connector. Figure 5 shows the gain register format.

Figure 5: Gain Register Format

**Start Channel/Current Channel Register**

User must load this register with the starting channel address when scanning a group of channels. This register contains the address of the channel being scanned. Figure 6 shows the format of this register.

Figure 6: Start Channel/Current Channel Register

**Final Channel Register**

User must load this register with the final channel address when scanning a group of channels. The on-board comparator compares this register contents with the current channel register and generates the end of scan (EOS) signal. Figure 7 shows the format of this register.

Figure 7: Final Channel Register Format

**Start Conversion Register**

Writing any value to this register starts an A/D conversions on the channel indicated by the current channel register. Figure 8 shows the format of this register.

Figure 8: Start Conversion Register Format

**A/D Data Register**

The 16 bits of the A/D data register are connected to 16 VMEbus data lines. The host system may read this register to obtain the binary data of the analog input from the channel selected. Models DVME-611/612 A, E, and B do not use the four least significant data bits. The value of these bits defaults to zero for these models. Figure 9 shows the format of this register.

Figure 9: A/D Register Format

**D/A Channel Registers**

The DVME-612 boards have two D/A channel registers. These registers form the input to the 12-bit hybrid D/A converters. These registers are programmable by the most significant 12 bits from the VMEbus data lines. Figure 10 shows the format of these registers.

Figure 10a: D/A Channel 0 Register Format

Figure 10b: D/A Channel 1 Register Format

**EOC/EOS F/F Register**

Writing any value to this register resets the EOC/EOS flip-flops. Figure 11 shows the format of this register.

**Figure 11: EOC/EOS F/F Register Format**

(These F/F's are also reset by the next start of conversion or by reading A/D data.)

**I/O Connections**

The DVME-611/612 A/D boards use the J1 and J2 connectors for analog input connections and the J4 connector for channel expansion. The DVME-612 uses the J3 connector for analog output connections. Tables 2, 3, 4, and 5 list the I/O signals of the J1, J2, J3, and J4 connector respectively.

**Table 3. DVME-611/612 Analog Input Connector - J1**

Base + 192 through Base + 255	Not used	

**ORDERING INFORMATION**

DVME-611  
(A/D only)  
DVME-612  
(A/D + D/A)

A - 12-bit/20  $\mu$ S ADC  
B - 12-bit/4  $\mu$ S ADC  
C - 16-bit/35  $\mu$ S ADC  
D - DISCONTINUED\*  
E - 12-bit/2  $\mu$ S ADC  
F - 14-bit/4  $\mu$ S

**Optional Multiplexer Expansion Boards**

DVME-641 - 32S/16D Channel high-level non-isolated inputs.  
DVME-643 - 8D Channel isolated inputs.  
DVME-645 - 16S/8D Channel simultaneous sample/hold high-level non-isolated inputs.

\*DVME-611D and -612D are discontinued. Use DVME-611C and -612C instead.

Each board includes a disk and manual.
