User Manual Standard Control Firmware 2.xxx Enhanced Control Firmware 2.xxx...4.xxx

## **Important User Information**

Solid state equipment has operational characteristics differing from those of electromechanical equipment. *Safety Guidelines for the Application, Installation and Maintenance of Solid State Controls* (Publication SGI-1.1 available from your local Rockwell Automation sales office or online at http://

**www.rockwellautomation.com/literature**) describes some important differences between solid state equipment and hard-wired electromechanical devices. Because of this difference, and also because of the wide variety of uses for solid state equipment, all persons responsible for applying this equipment must satisfy themselves that each intended application of this equipment is acceptable.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc. is prohibited.

Throughout this manual, when necessary we use notes to make you aware of safety considerations.

**WARNING:** Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

**Important:** Identifies information that is critical for successful application and understanding of the product.

**ATTENTION:** Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequences.

**Shock Hazard** labels may be located on or inside the equipment (e.g., drive or motor) to alert people that dangerous voltage may be present.

**Burn Hazard** labels may be located on or inside the equipment (e.g., drive or motor) to alert people that surfaces may be at dangerous temperatures.

PowerFlex, DriveExplorer, DriveExecutive, PLC, Force Technology, DPI, and SCANport are either trademarks or registered trademarks of Rockwell Automation, Inc.

ControlNet is a trademark of ControlNet International, Ltd.

DeviceNet is a trademark of the Open DeviceNet Vendor Association.

# Summary of Changes

The information below summarizes the changes to the PowerFlex 70 User Manual since the April 2006 release.

## **Parameter Updates**

The following parameters have been added or updated with firmware version 4.001 of the Enhanced Control option.

Description of New or Updated Information	Page
Parameter 476 [Scale1 In Value]	<u>3-50</u>
Parameter 477 [Scale1 In Hi]	<u>3-50</u>
Parameter 478 [Scale1 In Lo]	<u>3-50</u>
Parameter 482 [Scale2 In Value]	<u>3-50</u>
Parameter 483 [Scale2 In Hi]	<u>3-50</u>
Parameter 484 [Scale2 In Lo]	<u>3-50</u>

## **Additional Manual Updates**

Description of New or Updated Information	Page
List of Reference Materials expanded.	<u>P-2</u>
General Precautions updated.	P-3
Catalog number explanation updated. Frame sizes added.	<u>P-7</u>
Single-phase operation clarified.	<u>1-7</u>
MOV and CMC disconnection instructions expanded.	1-11
Drive supplied 24V DC (I/O Terminals 7, 8 and 9) intended usage clarified.	<u>1-16</u>
Details regarding possible changes to parameter default values during Motor Tests added.	<u>2-4</u>
Parameter 40 [Motor Type] Important note added regarding options 1 and 2.	<u>3-13</u>
Parameter 49 [Motor Poles] description expanded.	<u>3-13</u>
Parameter 50 [Motor OL Mode] related parameter reference corrected.	<u>3-14</u>
Parameter 56 [Compensation] option descriptions corrected.	<u>3-15</u>
P126 [PI Reference Sel] description expanded.	<u>3-26</u>
Parameter 153 [Regen Power Lim] description expanded.	<u>3-31</u>
Parameter 184 [Power Loss Mode] option descriptions added.	3-38
Parameter 192 [AutoMan Cnfg], Enhanced Control, description added.	3-39
Parameter 196 [Param Access Lvl] description expanded.	<u>3-40</u>
Parameter 238 [Fault Config 1] footnote 3 added.	<u>3-48</u>
Parameter 242 [Power Up Marker] description expanded.	<u>3-48</u>
Parameter 366 [Digital In6 Sel] is no longer changeable.	<u>3-59</u>

Description of New or Updated Information	Page
Parameter 380/384 [Digital OutX Sel] option 61 "Speed Fdbk" added.	<u>3-61</u>
Parameter 411 [DigIn DataLogic] description corrected.	3-60
Description expanded for Enable Hardware fault 111.	<u>4-4</u>
Description clarified for Power Loss fault 3.	<u>4-6</u>
Standard and Enhanced Control trip levels provided for UnderVoltage fault 4.	4-7
Cooling Fan Operation added.	<u>A-2</u>
Description of Speed Regulation with feedback corrected.	<u>A-3</u>
Watts Loss data added.	<u>A-4</u>
Frame Size reference table updated.	<u>A-8</u>
Tables added for Single-Phase Input Drive Ratings and Protection Devices	A-19
Section added on Using the HIM with a 20-HIM-B1 Bezel Kit.	<u>B-2</u>
Menu Structure for Start-Up corrected.	<u>B-4</u>
Discussion of Stop Modes expanded.	<u>C-4</u>

General Precautions	<u>P-3</u>
Catalog Number Explanation	P-7

## Who Should Use this Manual?

This manual is intended for qualified personnel. You must be able to program and operate Adjustable Frequency AC Drive devices. In addition, you must have an understanding of the parameter settings and functions.

## What <u>Is Not</u> in this Manual

The PowerFlex 70 User Manual is designed to provide only basic start-up information. For detailed drive information, please refer to the PowerFlex Reference Manuals, publications PFLEX-RM001 and PFLEX-RM004.

The reference manual and updates to this user manual are available online at http://www.rockwellautomation.com/literature.

## **Reference Materials**

For detailed PowerFlex 70 and related information refer to the following publications online at www.rockwellautomation.com/literature:

Title	Publication
PowerFlex 70 & 700 Reference Manual - Vol. 1	PFLEX-RM001
PowerFlex 70EC & 700VC Reference Manual	PFLEX-RM004
DriveGuard Safe-Off Option (Series B) for PowerFlex 40P and PowerFlex 70 AC Drives	20A-UM003
PowerFlex Comm Adapter Manuals	20COMM-UM
Dynamic Braking Resistor Calculator	PFLEX-AT001

The following manuals are recommended for general drive information:

Title	Publication	Available Online at
Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives	DRIVES-IN001	
Preventive Maintenance of Industrial Control and Drive System Equipment	DRIVES-TD001	
Safety Guidelines for the Application, Installation and Maintenance of Solid State Control	SGI-1.1	www.rockwellautomation.com/ literature
A Global Reference Guide for Reading Schematic Diagrams	100-2.10	
Guarding Against Electrostatic Damage	8000-4.5.2

## **Manual Conventions**

- In this manual we refer to the PowerFlex 70 Adjustable Frequency AC Drive as; drive, PowerFlex 70 or PowerFlex 70 Drive.
- To help differentiate parameter names and LCD display text from other text, the following conventions will be used:
  - Parameter Names will appear in [brackets].
     For example: [DC Bus Voltage].
  - Display Text will appear in "quotes." For example: "Enabled."
- The following words are used throughout the manual to describe an action:

Word	Meaning
Can	Possible, able to do something
Cannot	Not possible, not able to do something
May	Permitted, allowed
Must	Unavoidable, you must do this
Shall	Required and necessary
Should	Recommended
Should Not	Not recommended

## **Drive Frame Sizes**

Similar PowerFlex 70 drive sizes are grouped into frame sizes to simplify spare parts ordering, dimensioning, etc. A cross reference of drive catalog numbers and their respective frame size is provided in <u>Appendix A</u>.

## **General Precautions**

#### **Qualified Personnel**

**ATTENTION:** Only qualified personnel familiar with adjustable frequency AC drives and associated machinery should plan or implement the installation, start-up and subsequent maintenance of the system. Failure to comply may result in personal injury and/or equipment damage.

#### **Personal Safety**

**ATTENTION:** To avoid an electric shock hazard, verify that the voltage on the bus capacitors has discharged before performing any work on the drive. Measure the DC bus voltage at the +DC terminal of the Power Terminal Block and the -DC test point (refer to <a href="Chapter 1">Chapter 1</a> for locations). The voltage must be zero.

**ATTENTION:** Risk of injury or equipment damage exists. DPI or SCANport host products must not be directly connected together via 1202 cables. Unpredictable behavior can result if two or more devices are connected in this manner.

**ATTENTION:** The drive start/stop/enable control circuitry includes solid state components. If hazards due to accidental contact with moving machinery or unintentional flow of liquid, gas or solids exist, an additional hardwired stop circuit may be required to remove the AC line to the drive. An auxiliary braking method may be required.

## **Product Safety**

**ATTENTION:** An incorrectly applied or installed drive can result in component damage or a reduction in product life. Wiring or application errors, such as, undersizing the motor, incorrect or inadequate AC supply, or excessive ambient temperatures may result in malfunction of the system.

**ATTENTION:** This drive contains ESD (Electrostatic Discharge) sensitive parts and assemblies. Static control precautions are required when installing, testing, servicing or repairing this assembly. Component damage may result if ESD control procedures are not followed. If you are not familiar with static control procedures, reference A-B publication 8000-4.5.2, "Guarding Against Electrostatic Damage" or any other applicable ESD protection handbook.

**ATTENTION:** Configuring an analog input for 0-20 mA operation and driving it from a voltage source could cause component damage. Verify proper configuration prior to applying input signals.

**ATTENTION:** A contactor or other device that routinely disconnects and reapplies the AC line to the drive to start and stop the motor can cause drive hardware damage. The drive is designed to use control input signals that will start and stop the motor. If an input device is used, operation must not exceed one cycle per minute or drive damage will occur.

**ATTENTION:** Nuisance tripping may occur in Standard Control firmware version 1.011 and earlier due to unstable currents. When using a motor that is connected for a voltage that is different from the drive (e.g., using a 230V connected motor with a 460V drive) the following adjustment must be made to "Stability Gain" using DriveExplorer software and a personal computer.

 $\frac{\text{Motor Nameplate Voltage}}{\text{Drive Rated Voltage}} \times 128$ 

Any adjustment made to "Stability Gain" must be manually restored if the drive is reset to defaults or is replaced.

If unstable currents are still present after making the adjustment, contact the factory for assistance.

**ATTENTION:** The "adjust freq" portion of the bus regulator function is extremely useful for preventing nuisance overvoltage faults resulting from aggressive decelerations, overhauling loads, and eccentric loads. It forces the output frequency to be greater than commanded frequency while the drive's bus voltage is increasing towards levels that would otherwise cause a fault; however, it can also cause either of the following two conditions to occur.

- 1. Fast positive changes in input voltage (more than a 10% increase within 6 minutes) can cause uncommanded positive speed changes; however an F25 "OverSpeed Limit" fault will occur if the speed reaches P82 [Max Speed] + P83 [Overspeed Limit]. If this condition is unacceptable, action should be taken to 1) limit supply voltages within the specification of the drive and, 2) limit fast positive input voltage changes to less than 10%. Without taking such actions, if this operation is unacceptable, the "adjust freq" portion of the bus regulator function must be disabled (see parameters 161 [Bus Reg Mode A] and 162 [Bus Reg Mode B]).
- 2. Actual deceleration times can be longer than commanded deceleration times; however, a "Decel Inhibit" fault is generated if the drive stops decelerating altogether. If this condition is unacceptable, the "adjust freq" portion of the bus regulator must be disabled (see parameters 161 [Bus Reg Mode A] and 162 [Bus Reg Mode B]). In addition, installing a properly sized dynamic brake resistor will provide equal or better performance in most cases.

Note: These faults are not instantaneous and have shown test results that take between 2 and 12 seconds to occur.

## **Output Contactor Precaution**

ATTENTION: To guard against drive damage when using output contactors, the following information must be read and understood. One or more output contactors may be installed between the drive and motor(s) for the purpose of disconnecting or isolating certain motors/ loads. If a contactor is opened while the drive is operating, power will be removed from the respective motor, but the drive will continue to produce voltage at the output terminals. In addition, reconnecting a motor to an active drive (by closing the contactor) could produce excessive current that may cause the drive to fault. If any of these conditions are determined to be undesirable or unsafe, an auxiliary contact on the output contactor should be wired to a drive digital input that is programmed as "Enable." This will cause the drive to execute a coast-to-stop (cease output) whenever an output contactor is opened.

# Installation/Wiring

This chapter provides information on mounting and wiring the PowerFlex 70 Drive.

For information on	See page
Opening the Cover	1-1
Mounting Considerations	1-2
AC Supply Source Considerations	1-3
General Grounding Requirements	1-4
Fuses and Circuit Breakers	<u>1-5</u>
Power Wiring	<u>1-5</u>
Using Input/Output Contactors	1-10

For information on	See page
Disconnecting MOVs and Common Mode Capacitors	1-11
I/O Wiring	1-14
Speed Reference Control	1-22
Auto/Manual Examples	<u>1-23</u>
EMC Instructions	1-24

Most start-up difficulties are the result of incorrect wiring. Every precaution must be taken to assure that the wiring is done as instructed. All items must be read and understood before the actual installation begins.

**ATTENTION:** The following information is merely a guide for proper installation. Rockwell Automation, Inc. cannot assume responsibility for the compliance or the noncompliance to any code, national, local or otherwise for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.

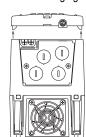

## **Opening the Cover**

## IP 20 (NEMA/UL Type 1)

1. Loosen cover screw.

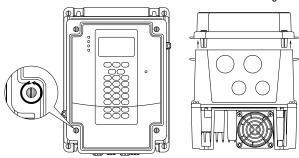

2. Pull cover straight off chassis to avoid damaging connector pins.

## IP 66 (NEMA/UL Type 4X/12)

1. Loosen the cover screws.

2. Pull cover straight off chassis.

Important: Torque cover screws to 0.79 N•m (7 lb•in).

## **Mounting Considerations**

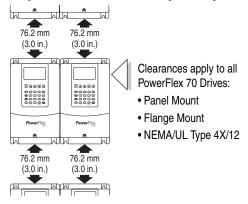

## **Maximum Surrounding Air Temperature**

Enclosure Rating	Temperature Range	
Open Type, IP 20, NEMA/UL Type 1 & Flange Mount	050 °C (32122 °F)	
IP 54, IP 66 & NEMA/UL Type 12	040 °C (32104 °F)	

Important: Some drives are equipped with an adhesive label on the top of the chassis. Removing the adhesive label from the drive changes the NEMA/UL enclosure rating from Type 1 Enclosed to Open Type.

## **Minimum Mounting Clearances**

Specified vertical clearance requirements are intended to be from drive to drive. Other objects can occupy this space; however, reduced airflow may cause protection circuits to fault the drive. In addition, inlet air temperature must not exceed the product specification.

## **AC Supply Source Considerations**

PowerFlex 70 drives are suitable for use on a circuit capable of delivering up to a maximum of 200,000 rms symmetrical amperes, and a maximum of 600 volts.

**ATTENTION:** To guard against personal injury and/or equipment damage caused by improper fusing or circuit breaker selection, use only the recommended line fuses/circuit breakers specified in <u>Appendix A</u>.

If a system ground fault monitor (Residual Current Device) is to be used, only Type B (adjustable) devices should be used to avoid nuisance tripping.

# **Unbalanced, Ungrounded, High Resistance or B Phase Grounded Distribution Systems**

If phase to ground voltage will exceed 125% of normal line to line voltage or the supply system is ungrounded, refer to the *Wiring and Grounding Guidelines for AC Drives* (publication DRIVES-IN001).

**ATTENTION:** PowerFlex 70 drives contain protective MOVs and common mode capacitors that are referenced to ground. To guard against drive damage, these devices must be disconnected if the drive is installed on an ungrounded, high-resistance or B phase grounded distribution system. See page 1-11 for jumper locations.

#### Input Power Conditioning

Certain events on the power system supplying a drive can cause component damage or shortened product life. These conditions are divided into 2 basic categories:

#### 1. All drives

- The power system has power factor correction capacitors switched in and out of the system, either by the user or by the power company.
- The power source has intermittent voltage spikes in excess of 6000 volts. These spikes could be caused by other equipment on the line or by events such as lightning strikes.
- The power source has frequent interruptions.

#### 2. 5 HP or Less Drives (in addition to "1" above)

- The nearest supply transformer is larger than 100 kVA or the available short circuit (fault) current is greater than 100,000 A.
- The impedance in front of the drive is less than 0.5%.

If any or all of these conditions exist, it is recommended that the user

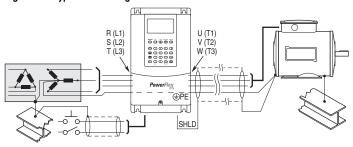

install a minimum amount of impedance between the drive and the source. This impedance could come from the supply transformer itself, the cable between the transformer and drive or an additional transformer or reactor. The impedance can be calculated using the information supplied in the *Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives*, publication DRIVES-IN001.

## **General Grounding Requirements**

The drive Safety Ground - PE must be connected to system ground. Ground impedance must conform to the requirements of national and local industrial safety regulations and/or electrical codes. The integrity of all ground connections should be periodically checked.

For installations within a cabinet, a single safety ground point or ground bus bar connected directly to building steel should be used. All circuits including the AC input ground conductor should be grounded independently and directly to this point/bar.

Figure 1.1 Typical Grounding

## Safety Ground - PE

This is the safety ground for the drive that is required by code. This point must be connected to adjacent building steel (girder, joist), a floor ground rod or bus bar (see above). Grounding points must comply with national and local industrial safety regulations and/or electrical codes.

#### **Shield Termination - SHLD**

The Shield terminal (see <u>Figure 1.2 on page 1-8</u>) provides a grounding point for the motor cable shield. The **motor cable** shield should be connected to this terminal on the drive (drive end) and the motor frame (motor end). A shield terminating cable gland may also be used.

When shielded cable is used for **control and signal wiring**, the shield should be grounded at the source end only, not at the drive end.

#### **RFI Filter Grounding**

Using an optional RFI filter may result in relatively high ground leakage currents. Therefore, the **filter must only be used in installations with grounded AC supply systems and be permanently installed and solidly grounded** (bonded) to the building power distribution ground. Ensure that the incoming supply neutral is solidly connected (bonded) to the same building power distribution ground. Grounding must not rely on flexible cables and should not include any form of plug or socket that would permit inadvertent disconnection. Some local codes may require redundant ground connections. The integrity of all connections should be periodically checked. Refer to the instructions supplied with the filter.

#### **Fuses and Circuit Breakers**

The PowerFlex 70 can be installed with either input fuses or an input circuit breaker. National and local industrial safety regulations and/or electrical codes may determine additional requirements for these installations. Refer to <a href="Appendix A">Appendix A</a> for recommended fuses/circuit breakers.

**ATTENTION:** The PowerFlex 70 does not provide branch short circuit protection. Specifications for the recommended fuse or circuit breaker to provide protection against short circuits are provided in Appendix A.

## **Power Wiring**

**ATTENTION:** National Codes and standards (NEC, VDE, BSI etc.) and local codes outline provisions for safely installing electrical equipment. Installation must comply with specifications regarding wire types, conductor sizes, branch circuit protection and disconnect devices. Failure to do so may result in personal injury and/or equipment damage.

## Cable Types Acceptable for 200-600 Volt Installations

A variety of cable types are acceptable for drive installations. For many installations, unshielded cable is adequate, provided it can be separated from sensitive circuits. As an approximate guide, allow a spacing of 0.3 meters (1 foot) for every 10 meters (32.8 feet) of length. In all cases, long parallel runs must be avoided. Do not use cable with an insulation thickness less than 15 mils (0.4 mm/0.015 in.). Use copper wire only. Wire gauge requirements and recommendations are based on 75 °C. Do not reduce wire gauge when using higher temperature wire.

#### **Unshielded**

THHN, THWN or similar wire is acceptable for drive installation in dry environments provided adequate free air space and/or conduit fill rates limits are provided. **Do not use THHN or similarly coated wire in wet areas**. Any wire chosen must have a minimum insulation thickness of 15 mils and should not have large variations in insulation concentricity.

#### Shielded/Armored Cable

Shielded cable contains all of the general benefits of multi-conductor cable with the added benefit of a copper braided shield that can contain much of the noise generated by a typical AC Drive. Strong consideration for shielded cable should be given in installations with sensitive equipment such as weigh scales, capacitive proximity switches and other devices that may be affected by electrical noise in the distribution system. Applications with large numbers of drives in a similar location, imposed EMC regulations or a high degree of communications / networking are also good candidates for shielded cable.

Shielded cable may also help reduce shaft voltage and induced bearing currents for some applications. In addition, the increased impedance of shielded cable may help extend the distance that the motor can be located from the drive without the addition of motor protective devices such as terminator networks. Refer to Reflected Wave in *Wiring and Grounding Guidelines for PWM AC Drives*, publication DRIVES-IN001.

Consideration should be given to all of the general specifications dictated by the environment of the installation, including temperature, flexibility, moisture characteristics and chemical resistance. In addition, a braided shield should be included and be specified by the cable manufacturer as having coverage of at least 75%. An additional foil shield can greatly improve noise containment.

A good example of recommended cable is Belden® 295xx (xx determines gauge). This cable has four (4) XLPE insulated conductors with a 100% coverage foil and an 85% coverage copper braided shield (with drain wire) surrounded by a PVC jacket.

Other types of shielded cable are available, but the selection of these types may limit the allowable cable length. Particularly, some of the newer cables bundle 4 conductors of THHN wire and wrap them tightly with a foil shield. This construction can greatly increase the cable charging current required and reduce the overall drive performance. Unless specified in the individual distance tables as tested with the drive, these cables are not recommended and their performance against the lead length limits supplied is not known.

Table 1.A Recommended Shielded Wire

Location	Rating/Type	Description
Standard (Option 1)	600V, 90 °C (194 °F) XHHW2/RHW-2 Anixter B209500-B209507, Belden 29501-29507, or equivalent	<ul> <li>Four tinned copper conductors with XLPE insulation.</li> <li>Copper braid/aluminum foil combination shield and tinned copper drain wire.</li> <li>PVC jacket.</li> </ul>
Standard (Option 2)	Tray rated 600V, 90 °C (194 °F) RHH/RHW-2 Anixter OLF-7xxxxx or equivalent	<ul> <li>Three tinned copper conductors with XLPE insulation.</li> <li>5 mil single helical copper tape (25% overlap min.) with three bare copper grounds in contact with shield.</li> <li>PVC jacket.</li> </ul>
Class I & II; Division I & II	Tray rated 600V, 90 °C (194 °F) RHH/RHW-2 Anixter 7V-7xxxx-3G or equivalent	<ul> <li>Three bare copper conductors with XLPE insulation and impervious corrugated continuously welded aluminum armor.</li> <li>Black sunlight resistant PVC jacket overall.</li> <li>Three copper grounds on #10 AWG and smaller.</li> </ul>

#### **EMC Compliance**

Refer to EMC Instructions on page 1-24 for details.

#### Cable Trays and Conduit

If cable trays or large conduits are to be used, refer to guidelines presented in Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication DRIVES-IN001.

**ATTENTION:** To avoid a possible shock hazard caused by induced voltages, unused wires in the conduit must be grounded at both ends. For the same reason, if a drive sharing a conduit is being serviced or installed, all drives using this conduit should be disabled. This will help minimize the possible shock hazard from "cross coupled" motor leads.

#### **Motor Cable Lengths**

Typically, motor lead lengths less than 30 meters (approximately 100 feet) are acceptable. However, if your application dictates longer lengths, refer to Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives for details.

## Single-Phase Input Power

The PowerFlex 70 drive is typically used with a three-phase input supply. The drive has been listed by U.L. to operate on single-phase input power with the following requirement:

 Output current is derated by 50% of the three-phase ratings identified in tables A.B through A.D.

## **Generator Input Power**

Contact Allen-Bradley Drives Technical Support for details on how to properly power a drive using generator power.

## **Power Terminal Block**

Figure 1.2 Typical Power Terminal Block Location (B Frame Shown)

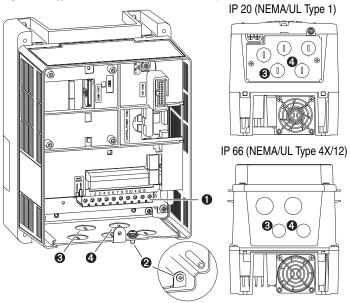

Table 1.B Power Terminal Block Specifications

				Wire Size Range <sup>(1)</sup>		Torque	
No.	Name	Frame	Description	Maximum	Minimum	Maximum	Recommended
0	Power Terminal Block	A, B, C	Input power and motor connections	4.0 mm <sup>2</sup> (10 AWG)	0.3 mm <sup>2</sup> (22 AWG)	1.1 N•m (10 lb•in)	0.8 N•m (7 lb•in)
		D	Input power and motor connections	10.0 mm <sup>2</sup> (6 AWG)	0.8 mm <sup>2</sup> (18 AWG)	1.7 N•m (15 lb•in)	1.4 N•m (12 lb•in)
		E	Input power and motor connections	25.0 mm <sup>2</sup> (3 AWG)	2.5 mm <sup>2</sup> (14 AWG)	2.71 N•m (24 lb•in)	2.71 N•m (24 lb•in)
0	SHLD terminal	All	Terminating point for wiring shields	_	_	1.6 N•m (14 lb•in)	1.6 N•m (14 lb•in)

<sup>(1)</sup> Maximum/minimum sizes that the terminal block will accept - these are not recommendations.

Table 1.C Wire Routing Recommendations

## IP66 (NEMA/UL Type 4X/12) Installations

Use the plugs supplied with IP66 (NEMA/UL Type 4X/12) rated drives to seal unused holes in the conduit entry plate.

**Important:** Completely seat the plug inner rim for the best seal.

## **Using Input/Output Contactors**

#### **Input Contactor Precautions**

**ATTENTION:** A contactor or other device that routinely disconnects and reapplies the AC line to the drive to start and stop the motor can cause drive hardware damage. The drive is designed to use control input signals that will start and stop the motor. If an input device is used, operation must not exceed one cycle per minute or drive damage will occur.

**ATTENTION:** The drive start/stop/enable control circuitry includes solid state components. If hazards due to accidental contact with moving machinery or unintentional flow of liquid, gas or solids exist, an additional hardwired stop circuit may be required to remove the AC line to the drive. An auxiliary braking method may be required.

#### **Output Contactor Precaution**

ATTENTION: To guard against drive damage when using output contactors, the following information must be read and understood. One or more output contactors may be installed between the drive and motor(s) for the purpose of disconnecting or isolating certain motors/ loads. If a contactor is opened while the drive is operating, power will be removed from the respective motor, but the drive will continue to produce voltage at the output terminals. In addition, reconnecting a motor to an active drive (by closing the contactor) could produce excessive current that may cause the drive to fault. If any of these conditions are determined to be undesirable or unsafe, an auxiliary contact on the output contactor should be wired to a drive digital input that is programmed as "Enable." This will cause the drive to execute a coast-to-stop (cease output) whenever an output contactor is opened.

## **Disconnecting MOVs and Common Mode Capacitors**

PowerFlex 70 drives contain protective MOVs and common mode capacitors that are referenced to ground. To guard against drive damage, these devices <u>must</u> be disconnected if the drive is installed on an ungrounded, high-resistance or B phase grounded distribution system. On an ungrounded distribution system where the line-to-ground voltages on any phase could exceed 125% of the nominal line-to-line voltage, an isolation transformer should be installed. To disconnect these devices, remove the jumper(s) listed under Phase to Ground MOV Removal (Figures <u>1.6</u> and <u>1.7</u>). Jumpers can be removed by carefully pulling the jumper straight out. See Wiring and Grounding Guidelines for PWM AC Drives, publication DRIVES-IN001 for more information on ungrounded systems.

**Important:** Common mode capacitors are required to conform with the EMC directive and MOV's are needed to meet UL certification. Removing these devices will withdraw the associated directive/certification.

**ATTENTION:** To avoid an electric shock hazard, verify that the voltage on the bus capacitors has discharged before removing/installing jumpers. Measure the DC bus voltage at the +DC terminal of the Power Terminal Block and the -DC test point on Frames A...D, or the -DC terminal of the Frame E Power Terminal Block. The voltage must be zero.

Figure 1.6 Frame A, C, D Jumper Locations (Frame C Shown)
Note: Frame A does not have a Common Mode jumper.

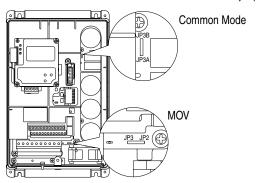

Figure 1.7 Frame B Jumper Locations

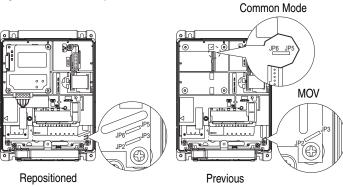

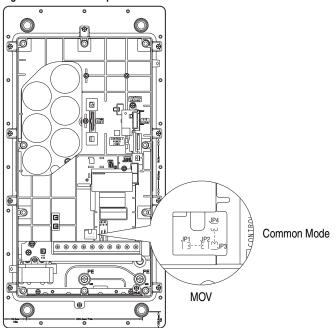

Figure 1.8 Frame E Jumper Locations

**ATTENTION:** When installing a drive on an ungrounded, high-resistance or B phase grounded distribution system, disconnect the phase-to-ground MOV circuit and the common mode capacitors from ground to guard against drive damage.

Figure 1.9 Phase to Ground MOV Removal

Frame	Jumper	Removes
A	N/A	
В	JP6 – JP5	Common Mode Capacitors to Ground
C and D	JP3B – JP3A	Common Mode Capacitors to Ground
E	JP3 – JP4	Common Mode Capacitors to Ground

## I/O Wiring

Important points to remember about I/O wiring:

- Use copper wire only. Wire gauge requirements and recommendations are based on 75 °C. Do not reduce wire gauge when using higher temperature wire.
- Wire with an insulation rating of 600V or greater is recommended.
- Control and signal wires should be separated from power wires by at least 0.3 meters (1 foot).

Important: I/O terminals labeled "(-)" Digital In Common or "Common" <u>are not</u> connected to earth ground and are designed to greatly reduce common mode interference. Grounding these terminals can cause signal noise.

**ATTENTION:** Configuring an analog input for 0-20mA operation and driving it from a voltage source could cause component damage. Verify proper configuration prior to applying input signals.

**ATTENTION:** Hazard of personal injury or equipment damage exists when using bipolar input sources. Noise and drift in sensitive input circuits can cause unpredictable changes in motor speed and direction. Use speed command parameters to help reduce input source sensitivity.

#### **Signal and Control Wire Types**

Table 1.D Recommended Signal Wire

Signal Type	Wire Type(s)	Description	Minimum Insulation Rating
Analog I/O	Belden 8760/9460 (or equiv.)	0.750 mm <sup>2</sup> (18AWG), twisted pair, 100% shield with drain <sup>(1)</sup> .	300V, 7590 °C
	Belden 8770 (or equiv.)	0.750 mm <sup>2</sup> (18AWG), 3 conductor, shielded for remote pot only.	(167194 °F)
Encoder	Belden 9728 (or equiv.)	0.196 mm <sup>2</sup> (24 AWG), individually shielded.	
EMC Compliance	Refer to EMC Instructions on pa	ge 1-24 for details.	

<sup>(1)</sup> If the wires are short and contained within a cabinet which has no sensitive circuits, the use of shielded wire may not be necessary, but is always recommended.

Table 1.E Recommended Control Wire for Digital I/O

	Wire Type(s)	Description	Minimum Insulation Rating
Unshielded	Per US NEC or applicable national or local code	_	300V, 60 °C
Shielded	Multi-conductor shielded cable such as Belden 8770 (or equiv.)	0.750 mm <sup>2</sup> (18AWG), 3 conductor, shielded.	(140 °F)

## I/O Terminal Block

Figure 1.11 Typical I/O Terminal Block Location (B Frame Shown)

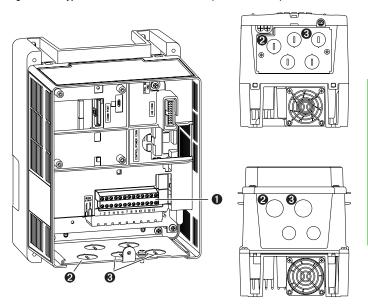

Table 1.F I/O Terminal Block Specifications

			Wire Size Range <sup>(1)</sup>		Torque	
No.	Name	Description	Maximum	Minimum	Maximum	Recommended

22	10V Pot Common Analog Out (- Volts) Analog Out (- Current)	Output 0 to 20mA, 10 bit, 10k ohm (2k ohm minimum) load.  Output 0 to 20mA, 10 bit, 400 ohm maximum load. (5)  Freq Referenced to chassis ground.		340 - 344
23	Analog Out (+ Volts) Analog Out (+ Current)		Common if internal 10V supply (terminal 10) is used.	
24	Digital Out 2 – N.O. <sup>(1)</sup>	Run	See description at No.s 11-13.	
25	Digital Out 2 Common			387
26	Digital Out 2 – N.C. <sup>(1)</sup> NOT Run			

<sup>(1)</sup> Contacts shown in unpowered state. Any relay programmed as Fault or Alarm will energize (pick up) when power is applied to drive and deenergize (drop out) when fault or alarm exists. Relays selected for other functions will energize only when that condition exists and will deenergize when condition is removed.

 $<sup>^{(2)}</sup>$  These inputs/outputs are dependent on a number of parameters. See "Related Parameters."

 $<sup>^{(3)}</sup>$  Differential Isolation - External source must be less than 10V with respect to PE.

Differential Isolation - External source must be maintained at less than 160V with respect to PE. Input provides high common mode immunity.

<sup>(5)</sup> Analog output current is only available with Enhanced Control drives.

## I/O Wiring Examples

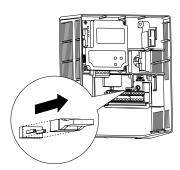

The following basic wiring examples may differ from your application.

Input/Output	Connection Example	Required Parameter Settings
Potentiometer Unipolar Speed Reference 10k Ohm Pot. Recommended (2k Ohm minimum)	18 19 19 10 00 00 22	Select Speed Reference source: Param. 090 = 2 "Analog In 2" Adjust Scaling: Param. 091, 092, 322, 323 Check Results: Param. 017
Joystick Bipolar Speed Reference ±10V Input	18 9 19 19 19 19 19 19 19 19 19 19 19 19 1	Set Direction Mode: Param. 090 = 2 "Analog In 2" Param. 190 = 1 "Bipolar" Adjust Scaling: Param. 091, 092, 325, 326 Check Results: Param. 017
Analog Input Bipolar Speed Reference ±10V Input	18 19	Adjust Scaling: Param. 091, 092, 325, 326 Check Results: Param. 017

2 Wire Control	External Supply	Set Digital Input 1:
Reversing	Run Rev . IIAL	Param. 361 = 9 "Run Reverse"
	Run Fwd	Set Digital Input 2: Param. 362 = 8 "Run Forward"
3 Wire Control	Internal Supply	Use factory default parameter
	Stop 1	settings.
3 Wire Control	External Supply	Use factory default parameter
	Stop 2 Start	settings.
Digital Output		Select Source:
Form C Relays Energized in Normal State.	Or 24 25 Aur 26 NOT Run Power Source	Param. 380, 384
Enable Input		Standard Control
Shown in enabled state.		Configure with parameter 366  Enhanced Control Configure with parameter 366 For dedicated hardware Enable: Remove Enable Jumper (see page 1-19)

## Hardware Enable Circuitry (Enhanced Control Only)

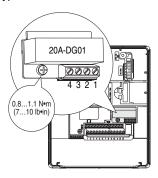

By default, the user can program a digital input as an Enable input. The status of this input is *interpreted by drive software*. If the application requires the drive to be disabled *without* software interpretation, a hardware enable configuration can be utilized. This is done by removing the enable jumper (ENBL JMP) and wiring the enable input to "Digital In 6" (see below). Note that P366 [Digital In6 Sel] is no longer changeable.

- **1.**Remove drive cover as described on pages <u>1-1</u> and <u>1-2</u>.
- **2.**Locate and remove the Enable Jumper on the Main Control Board (see diagram).
- **3.**Wire Enable to "Digital In 6" (see <u>Table 1.H</u>).

## Safe Off Board (Enhanced Control Only)

The PowerFlex Safe-Off board, when used with suitable safety components, provides protection according to EN 954-1:1997; Category 3 for safe off and protection against restart. The PowerFlex safe off option is just one safety control system. All components in the system must be chosen and applied correctly, to achieve the desired level of operator safeguarding.

Important: The hardware enable jumper (ENBL JMP) must be removed when using the DriveGuard Safe-Off option. Failure to remove the jumper will cause the drive to fault when a start command is issued.

**Table 1.I Terminal Description** 

No.	Signal	Description	
1	Monitor - N.C.	Normally closed contacts for monitoring relay status.	
2	Common - N.C.	Maximum Resistive Load: 250V AC / 30V DC / 50 VA / 60 Watts Maximum Inductive Load: 250V AC / 30V DC / 25 VA / 30 Watts	
3	+24V DC	Connections for year symplical power to energine soil	
4	24V Common	Connections for user supplied power to energize coil.	

For detailed information on installing and wiring a safety relay system, refer to the DriveGuard" Safe-Off Option (Series B) for PowerFlex 40P and PowerFlex 70 AC Drives User Manual, publication PFLEX-UM003.

Important: If the Safe-Off board is removed from the drive, pins 3 and 4 of the Safe-Off Connector must be jumpered for the drive to run. If the Safe-Off board or the jumper is not installed, and the drive is commanded to run, an F111 "Enable Hardware" fault will occur.

## **Encoder Interface (Enhanced Control Only)**

The PowerFlex Encoder Interface can source 5 or 12 volt power and accept 5 or 12 volt single ended differential inputs.

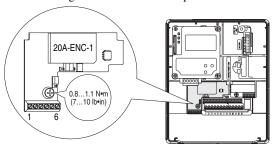

Table 1.J Terminal Description

No.	Signal	Description	
1	5-12V Power	Internal power source 250 mA (isolated).	
2	Power Return	finiernai power source 250 mA (isolateu).	
3	Encoder B (NOT)	Single channel or quadrature B input.	
4	Encoder B		
5	Encoder A (NOT)	Single channel or quadrature A input.	
6	Encoder A		

Figure 1.13 Jumper Settings

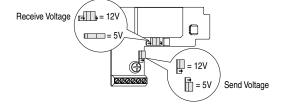

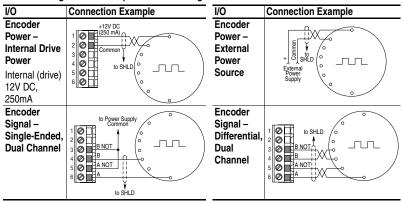

Figure 1.14 Sample Encoder Wiring

Refer to page A-3 for additional Encoder specifications.

### **Speed Reference Control**

### "Auto" Speed Sources

The drive speed command can be obtained from a number of different sources. The source is determined by drive programming and the condition of the speed select digital inputs, Auto/Manual digital input or reference select bits of a command word.

The default source for a command reference (all speed select inputs open or not programmed) is the selection programmed in P90 [Speed Ref A Sel]. If any of the speed select inputs are closed, the drive will use other parameters as the speed command source.

If a communication device is the source of the speed reference, refer to the appropriate Communications manual for additional information.

### "Manual" Speed Sources

The manual source for speed command to the drive is either the HIM requesting manual control (see <u>ALT Functions on page B-3</u>) or the control terminal block (analog input 1, 2, or MOP based on P96 [TB Man Ref Sel]) if a digital input is programmed to "Auto/Manual".

#### **Changing Speed Sources**

The selection of the active Speed Reference can be made through digital inputs, DPI command, jog button or Auto/Manual HIM operation.

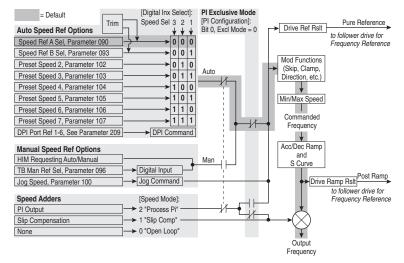

Figure 1.15 Speed Reference Selection Chart (1)

<sup>(1)</sup> To access Preset Speed 1, set [Speed Ref A Sel] or [Speed Ref B Sel] to "Preset Speed 1".

### **Auto/Manual Examples**

#### PLC = Auto, HIM = Manual

A process is run by a PLC when in Auto mode and requires manual control from the HIM during set-up. The Auto speed reference is issued by the PLC through a communications module installed in the drive. Since the internal communications is designated as Port 5, P90 [Speed Ref A Sel] is set to "DPI Port 5" with the drive running from the Auto source.

#### Attain Manual Control

Press ALT then Auto/Man on the HIM.

When the HIM attains manual control, the drive speed command comes from the HIM speed control keys.

#### Release to Auto Control

Press ALT then Auto/Man on the HIM again.
 When the HIM releases manual control, the drive speed command returns to the PLC.

#### PLC = Auto, Terminal Block = Manual

A process is run by a PLC when in Auto mode and requires manual control from an analog potentiometer wired to the drive terminal block. The auto speed reference is issued by the PLC through a communications module installed in the drive. Since the internal communications is designated as Port 5, P90 [Speed Ref A Sel] is set to "DPI Port 5" with the drive running from the Auto source. Since the Manual speed reference is issued by an analog input ("Analog In 1 or 2"), P96 [TB Man Ref Sel] is set to the same input. To switch between Auto and Manual, [Digital In4 Sel] is set to "Auto/ Manual".

#### Attain Manual Control

Close digital input 4.
 With the input closed, the speed command comes from the potentiometer.

#### Release to Auto Control

Open digital input 4.
 With the input open, the speed command returns to the PLC.

### **Auto/Manual Notes**

- 1. Manual control is exclusive. If a HIM or Terminal Block takes manual control, no other device can take manual control until the controlling device releases manual control.
- **2.** If a HIM has manual control and power is removed from the drive, the drive will return to Auto mode when power is reapplied.

#### **EMC Instructions**

### CE Conformity<sup>(1)</sup>

Conformity with the Low Voltage (LV) Directive and Electromagnetic Compatibility (EMC) Directive has been demonstrated using harmonized European Norm (EN) standards published in the Official Journal of the European Communities. PowerFlex Drives comply with the EN standards listed below when installed according to the instructions in this manual and the *Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives*, publication DRIVES-IN001.

CE Declarations of Conformity are available online at: http://www.ab.com/certification/ce/docs.

#### Low Voltage Directive (2006/95/EC)

• EN50178 Electronic equipment for use in power installations

#### EMC Directive (89/336/EEC)

• EN61800-3 Adjustable speed electrical power drive systems Part 3: EMC product standard including specific test methods.

#### **General Notes**

- If the adhesive label is removed from the top of the drive, the drive must be installed in an enclosure with side openings less than 12.5 mm (0.5 in.) and top openings less than 1.0 mm (0.04 in.) to maintain compliance with the LV Directive.
- The motor cable should be kept as short as possible in order to avoid electromagnetic emission as well as capacitive currents.
- Use of line filters in ungrounded systems is not recommended.
- PowerFlex drives may cause radio interference if used in a
  residential or domestic environment. The installer is required to take
  measures to prevent interference, in addition to the essential
  requirements for CE compliance provided in this section, if
  necessary.
- Conformity of the drive with CE EMC requirements does not guarantee an entire machine or installation complies with CE EMC requirements. Many factors can influence total machine/installation compliance.
- PowerFlex drives generate conducted low frequency disturbances (harmonic emissions) on the AC supply system.
- (1) CE Certification testing has not been completed for 600 Volt class drives.

### **General Notes (continued)**

 When operated on a public supply system, it is the responsibility of the installer or user to ensure, by consultation with the distribution network operator and Rockwell Automation if necessary, that applicable requirements have been met.

#### **Essential Requirements for CE Compliance**

Conditions 1-6 listed below **must be** satisfied for PowerFlex drives to meet the requirements of **EN 61800-3:2004**.

- 1. Standard PowerFlex 70 CE compatible Drive.
- **2.** Review important precautions/attention statements throughout this manual before installing the drive.
- 3. Grounding as described on page 1-5.
- **4.** Output power, control (I/O) and signal wiring must be braided, shielded cable with a coverage of 75% or better, metal conduit, or equivalent attenuation.
- **5.** All shielded cables should terminate with the proper shielded connector.
- **6.** Conditions in Table <u>1.K</u> or <u>1.L</u>.

Table 1.K PowerFlex 70 EN61800-3 EMC Compatibility

		Second Enviro	nment			
ø		Restrict Motor	Internal			First Environment
Frame		Cable to	Filter	External	Input	Restricted
芷	Drive Description	40 m (131 ft)	Option	Filter	Ferrite <sup>(1)</sup>	Distribution

	2 w/o DC CM Capacitor	FN3258-42-47	150	150	-	-	-
	3	FN3258-75-52	100	100	_	_	_
	3 w/o DC CM Capacitor	FN3258-75-52	150	150	_	-	Ť

 $<sup>^{(1)}\,\,</sup>$  Use of these filters assumes that the drive is mounted in an EMC enclosure.

<b>1-28</b> Installation/Wirir	10
--------------------------------	----

Notes:

# **Start Up**

This chapter describes how you start up the PowerFlex 70 Drive. Refer to Appendix B for a brief description of the LED and LCD HIM (Human Interface Module).

For information on	See page
Prepare For Drive Start-Up	<u>2-1</u>
Status Indicators	<u>2-3</u>
Start-Up Routines	2-4
Running S.M.A.R.T. Start	<u>2-5</u>
Running an Assisted Start Up	2-5

### **Prepare For Drive Start-Up**

- The check list that follows supports the Start-Up menu option.
- A Human Interface Module (HIM) is required to run the Start-Up routine.
- The Start-Up routine may modify parameter values for Analog and Digital I/O.

ATTENTION: Power must be applied to the drive to perform the following start-up procedure. Some of the voltages present are at incoming line potential. To avoid electric shock hazard or damage to equipment, only qualified service personnel should perform the following procedure. Thoroughly read and understand the procedure before beginning. If an event does not occur while performing this procedure, **Do Not Proceed. Remove Power** including user supplied control voltages. User supplied voltages may exist even when main AC power is not applied to the drive. Correct the malfunction before continuing.

#### **Before Applying Power to the Drive**

- 1. Confirm that all inputs are connected to the correct terminals and are secure.
- ☐ 2. Verify that AC line power at the disconnect device is within the rated value of the drive.

**3.** Verify that control power voltage is correct.

The remainder of this procedure requires that a HIM be installed. If an operator interface is not available, remote devices should be used to start up the drive.

**Important:** When power is first applied, the HIM may require approximately 5 seconds until commands are recognized (including the Stop key).

### **Applying Power to the Drive**

**4.** Apply AC power and control voltages to the drive.

If any of the six digital inputs are configured to "Stop – CF" (CF = Clear Fault) or "Enable," verify that signals are present or the drive will not start. Refer to <u>Alarm Descriptions on page 4-8</u> for a list of potential digital input conflicts.

If a fault code appears, refer to Chapter 4.

If the STS LED is not flashing green at this point, refer to Status Indicators and their indications below.

**□ 5.** Proceed to Start-Up Routines.

## **Status Indicators**

Figure 2.1 Drive Status Indicators (Typical)

#	Name	Color	State	Description			
0	STS	Green	Flashing	Drive ready, but not running and no faults are present.			
_	(Status)		Steady	Drive running, no faults are present.			
		Yellow See page 4-8	Flashing, Drive Stopped	An inhibit condition exists, the drive cannot be started. Check parameter 214 [Start Inhibits].			
		' ' -	Flashing, Drive Running	An intermittent type 1 alarm condition is occurring. Check parameter 211 [Drive Alarm 1].			
			Steady, Drive Running	A continuous type 1 alarm condition exists. Check parameter 211 [Drive Alarm 1].			
		Red See page 4-3	Flashing	A fault has occurred. Check parameters 243, 245, 247 and 249			
			Steady	A non-resetable fault has occurred.			
0	PORT		ommunication	Status of DPI port internal communications (if present).			
	MOD	Adapter User	Manual.	Status of communications module (when installed).			
	NET A			Status of network (if connected).			
	NET B			Status of secondary network (if connected).			

### **Start-Up Routines**

The PowerFlex 70 is designed so that start up is simple and efficient. If you have an LCD HIM, two methods are provided, allowing the user to select the desired level needed for the application.

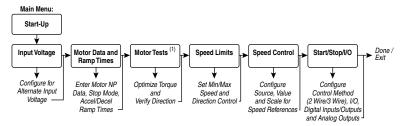

#### S.M.A.R.T. Start

This routine allows you to quickly set up the drive by programming values for the most commonly used functions (see below).

#### Assisted Start Up

This routine prompts you for information that is needed to start up a drive for most applications, such as line and motor data, commonly adjusted parameters and I/O. With Enhanced Control, two levels of Assisted Start Up are provided; Basic and Detailed.

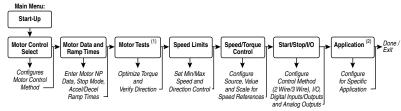

Figure 2.2 Standard Control Start Up Menu

If you do not have an LCD HIM, you must set parameters individually using the LED HIM or other configuration tools, Refer to <u>Chapter 3</u> for parameters.

**Important:** Power must be applied to the drive when viewing or changing parameters. Previous programming may affect the drive status when power is applied.

Figure 2.3 Enhanced Control Start Up Menu

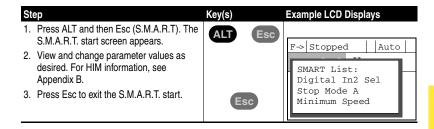

- (1) During Motor Tests and tuning procedures, the drive may modify certain parameter values for proper Start Up operation. These values are then reset to their original values when Start Up is complete. The affected parameters are: 053, 080, 276, 278 and 361-366. If power is removed from the drive during the tests without aborting the auto-tune procedure, these parameters may not be reset to their original value. If this situation occurs, reset the drive to factory defaults and repeat the Start Up procedure.
- (2) Detailed start-up mode only.

### **Running S.M.A.R.T. Start**

During a Start Up, the majority of applications require changes to only a few parameters. The LCD HIM on a PowerFlex 70 drive offers S.M.A.R.T. start, which displays the most commonly changed parameters. With these parameters, you can set the following functions:

- S Start Mode and Stop Mode
- M Minimum and Maximum Speed
- A Accel Time 1 and Decel Time 1
- R Reference Source
- T Thermal Motor Overload

To run a S.M.A.R.T. start routine:

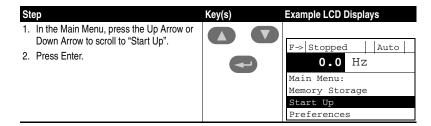

### **Running an Assisted Start Up**

Important: This start-up routine requires an LCD HIM.

The Assisted start-up routine prompts you to input required information. Access Assisted Start Up by selecting "Start Up" from the Main Menu.

To perform an Assisted Start-Up

**Important:** Done/Exit must be selected upon completion of the Start Up routine in order for any Start Up/Autotune data to be saved.

Notes:

# **Programming and Parameters**

Chapter 3 provides a complete listing and description of the PowerFlex 70 parameters. The parameters can be programmed (viewed/edited) using an LED or LCD HIM (Human Interface Module). As an alternative, programming can also be performed using DriveExplorer<sup>TM</sup> or DriveExecutive<sup>TM</sup> software and a personal computer. Refer to Appendix B for brief descriptions of the LED and LCD Human Interface Modules.

### **About Parameters**

To configure a drive to operate in a specific way, drive parameters may have to be set. Three types of parameters exist:

#### ENUM Parameters

ENUM parameters allow a selection from 2 or more items. The LCD HIM will display a text message for each item. The LED HIM will display a number for each item.

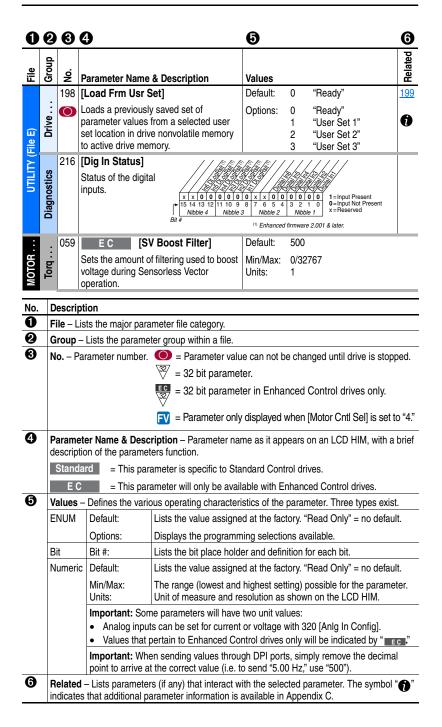

#### Bit Parameters

Bit parameters have individual bits associated with features or conditions. If the bit is 0, the feature is off or the condition is false. If the bit is 1, the feature is on or the condition is true.

#### • Numeric Parameters

These parameters have a single numerical value (i.e. 0.1 Volts).

The example on the following page shows how each parameter type is presented in this manual.

### **How Parameters are Organized**

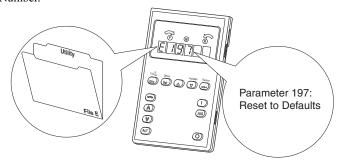

### **LED HIM (Human Interface Module)**

The LED HIM displays parameters in **Numbered List** order. Parameters are accessed by first selecting the file letter then a parameter number.

**Important:** The PowerFlex 70 Enhanced Control drive does not support the LED HIM.

File Letter Designations

The LED HIM identifies each parameter by File Letter and Parameter Number.

### **LCD HIM (Human Interface Module)**

The LCD HIM displays parameters in a **File-Group-Parameter** or **Numbered List** view order. To switch display mode, access the Main Menu, press ALT then Sel while cursor is on the parameter selection. In addition, using 196 [Param Access Lvl], the user has the option to display *all* parameters, commonly used parameters or diagnostic parameters.

### **Control Options**

Two different control options are available for the PowerFlex 70; Standard and Enhanced. Standard Control drives provide Volts per Hertz and Sensorless Vector operation. Enhanced Control drives support the addition of FVC Vector Control, DriveGuard Safe Off option and more.

### **3-4** Programming and Parameters

### File-Group-Parameter View

This simplifies programming by grouping parameters that are used for similar functions. The parameters are organized into 6 files in Basic Parameter view or 7 files in Advanced Parameter view. Each file is divided into groups, and each parameter is an element in a group. By default, the LCD HIM displays parameters by File-Group-Parameter view.

### Numbered List View

All parameters are in numerical order.

### **Basic Parameter View – Standard Control**

		445	E C v2 [Ki Speed Loop]	Default:	7.8	053
SPEED COMMAND (File C)		FV	Controls the integral error gain of the speed regulator. The drive automatically adjusts P445 [Ki Speed Loop] when a non-zero value is entered for P449 [Speed Desired BW] or an autotune is performed. Typically, manual adjustment of this parameter is needed only if system inertia cannot be determined through an autotune. P449 [Speed Desired BW] is set to "0" when a manual adjustment is made to this parameter.	Min/Max: Units:	0.0/4000.0 0.1	449 450
e G		446	E C v2 [Kp Speed Loop]	Default:	6.3	<u>053</u>
SPEI	Speed Regulator	FV	Controls the proportional error gain of the speed regulator. The drive automatically adjusts P446 [Kp Speed Loop] when a non-zero value is entered for P449 [Speed Desired BW] or an auto-tune is performed. Typically, manual adjustment of this parameter is needed only if system inertia cannot be determined through an autotune. P449 [Speed Desired BW] is set to "0" when a manual adjustment is made to this parameter.	Min/Max: Units:	0.0/200.0 0.1	449 450
		447	E C v2 [Kf Speed Loop]	Default:	0.0	<u>053</u>
		FV	Controls the feed forward gain of the speed regulator. Setting the Kf gain greater than zero reduces speed feedback overshoot in response to a step change in speed reference.	Min/Max: Units:	0.0/0.5 0.1	
		448	E C v3 [Spd Err Filt BW]	Default:	200.0 R/s	<u>053</u>
		FV	Sets the bandwidth of a speed error filter used in FVC Vector mode. A setting of 0.0 disables the filter.	Min/Max: Units:	0.0/2000.0 R/s 0.1 R/s	

File C	Group	No.	Parameter Name and Description See page 3-2 for symbol descriptions	Values		Related
		449	E C v2 [Speed Desired BW]	Default:	0.0 Radians/Sec	053
ID (File C)	ılator	FV	Sets the speed loop bandwidth and determines the dynamic behavior of the speed loop. As bandwidth increases, the speed loop becomes more responsive and can track a faster changing speed reference.  Adjusting this parameter will cause the drive to calculate and change P445 [Ki Speed Loop] and P446 [Kp Speed Loop] gains.	Min/Max: Units:	0.0/250.0 Radians/Sec 0.1 Radians/Sec	067 445 446
Æ	nga	450	E C v2 [Total Inertia]	Default:	0.10 Secs	053
SPEED COMMAND (File C)	Speed Regulator	FV	Represents the time in seconds, for a motor coupled to a load to accelerate from zero to base speed, at rated motor torque. The drive calculates Total Inertia during the autotune inertia procedure. Adjusting this parameter will cause the drive to calculate and change P445 [Ki Speed Loop] and P446 [Kp Speed Loop] gains.	Min/Max: Units:	0.01/600.0 Secs 0.01 Secs	067 445 446 449
		451	E C v2 [Speed Loop Meter]	Default:	Read Only	053
		FV	Value of the speed regulator output. When in FVC mode, units are in percent.	Min/Max: Units:	-/+800.0%/Hz 0.1%/Hz	<u>121</u>

## Inputs & Outputs File (File J)

File J	Group	No.	Parameter Name and Description See page 3-2 for symbol descriptions	Values		Related
S (File J)	Analog Outputs	343	[Analog Out1 Hi]	Default:	10.00 Volts	340
			Sets the analog output value when the source value is at maximum.	Min/Max: Units:	0.00/10.00 Volts 0.00/20.00 mA EC 0.01 Volt 0.01 mA EC	342
		344	[Analog Out1 Lo]	Default:	0.00 Volts	<u>340</u>
			Sets the analog output value when the source value is at minimum.	Min/Max:	0.00/10.00 Volts 0.00/20.00 mA	<u>342</u>
				Units:	0.01 Volt 0.01 mA EC	
Ξ		354	E C [Anig Out1 Scale]	Default:	0.0	341
INPUTS & OUTPUTS (File J)			Sets the high value for the range of analog out scale. Entering 0.0 will disable this scale and max scale will be used. Example: If [Analog Out Sel] = "Commanded Trq," a value of 150 = 150% scale in place of the default 800%.	Min/Max: Units:	[Analog Out1 Sel] 0.01	342
		377	E C [Anig Out1 Setpt]	Default:	0.00 Volts	<u>340</u>
			Controls the analog output value from a communication device.	Min/Max:	0.00/20.00 mA	
			Example	Units:	0.01 Volt 0.01 mA	
			Set [Data In A1] to "377" which will be the value from the communication device.		O.OT IIIA	

File J	Group	Vo	Parameter Name and Description See page 3-2 for symbol descriptions Values	Related
INPUTS & OUTPUTS (File J)	Digital Inputs Group	361 362 363 364 365 366	See page 3-2 for symbol descriptions	100 156 162 096 140 194 380 125 12) 13) 088 108 124 15) 205
			(8) Auto/Manual - Refer to Figure 1.15 on page 1-22 for details.  (9) Typical 3-Wire Inputs - Requires that only 3-wire functions are chosen. Including 2-wire selections will cause a type 2 alarm.  (8) Auto/Manual - Refer to Figure 1.15 on 3640 "Reserved" 41-42 "UserSet Sel1-2" 41-42 "UserSet Sel1-2" 42 "Run Level"(5)(12) 43 "Run Level"(5)(12) 44 "Run Fwd Level"(5) 45 "Run Rev Level"(5) 46 "Run W/Comm"(5)	(12) (12)
			(10) Typical 2-Wire Inputs - Requires that only 2-wire functions are chosen. Including 3-wire selections will cause a type 2 alarm.  (11) A "Dig In ConflictB" alarm will occur if a "Start" input is programmed without a "Stop" input. Type 2 Alarms - Some digital input programming may cause conflict that will result in a Type 2 alarm. Example: [Digital In1 Sel] set to 5 "Start" in 3-v control and [Digital In2 Sel] set to 7 "Run" in 2-wire. Refer to Alarm Descriptions page 4-8 for information on resolving this type of conflict.	620 ets rire
			(12) Refer to Option Definitions on page 3-62. (13) Enhanced Firmware V3.002 and later.

INPUTS & OUTPUTS (File J)	Digital Outputs		a (CRx) output relay.  (1) Any relay programmed as Fault or Alarm will energize (pick up) when power is applied to drive and deenergize (drop out) when a fault or alarm exists. Relays selected for other functions will energize only when that condition exists and will deenergize when condition is removed. Refer to page 1-16.  (2) Activation level is defined in [Dig Outx Level] below.  (3) Enhanced Control Drives Only.  (4) Enhanced Firmware V3.002 and later.  (5) Enhanced Firmware V4.001 and later.	Options:	2 "Alarm"(1) 3 "Ready" 4 "Run" 5 "Forward Run" 6 "Reverse Run" 7 "Auto Restart" 8 "Powerup Run" 9 "At Speed" 10 "At Freq"(2) 11 "At Current"(2) 12 "At Torque"(2) 13 "At Temp"(2) 14 "At Bus Volts"(2) 15 "At PI Error"(2) 16 "DC Braking" 17 "Curr Limit" 18 "Economize" 19 "Motor Overld" 20 "Power Loss" 21 "Input 1 Link" 22 "Input 2 Link" 23 "Input 3 Link" 24 "Input 4 Link" 25 "Input 5 Link" 26 "Input 6 Link" 27 "PI Enabled"(3) 28 "PI Hold"(3) 29 "Drive Overld"(3) 30 "Param Cntt"(3) 31-57 "Reserved" 58 "Manual Mode"(4) 59 "Fast Braking"(4) 60 "Reserved" 61 "Speed Fdbk"(2)(5)	002 001 003 004 218 012 137 157 147 053 048 184
		381 385	[Dig Out1 Level] [Dig Out2 Level]	Default:	0.0 0.0	380
			Sets the relay activation level for options 10 – 15 in [Digital Outx Sel]. Units are assumed to match the above selection (i.e. "At Freq" = Hz, "At Torque" = Amps).	Min/Max: Units:	0.0/819.2 0.1	
		382 386	[Dig Out1 OnTime] [Dig Out2 OnTime]	Default:	0.0 Secs 0.0 Secs	380
			Sets the "ON Delay" time for the digital outputs. This is the time between the occurrence of a condition and activation of the relay.	Min/Max: Units:	0.0/600.0 Secs 0.1 Secs	

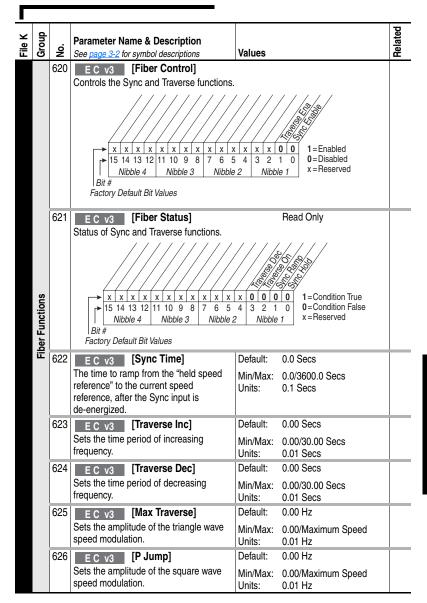

File J	Group	No.	Parameter Name and Description See page 3-2 for symbol descriptions	Values		Related
INPUTS & OUTPUTS (File J)	Digital Outputs	383 387	[Dig Out1 OffTime] [Dig Out2 OffTime]  Sets the "OFF Delay" time for the digital outputs. This is the time between the disappearance of a condition and de-activation of the relay.	Default: Min/Max: Units:	0.0 Secs 0.0 Secs 0.0/600.0 Secs 0.1 Secs	380

#### Selected Option Definitions – [Analog Outx Sel], [Digital Inx Sel], [Digital Outx Sel]

Option	Description	Related			
At Speed	Relay changes state when drive has reached commanded speed.	380			
Excl Link	Links digital input to a digital output if the output is set to "Input 1-6 Link."	<u>361</u>			
Input 1-6 Link	When Digital Output 1 is set to of these (i.e. Input 3 Link) in conjunction with Digital Input 3 set to "Excl Link," the Digital Input 3 state (on/off) is echoed in the Digital Output 1.	380			
Manual Mode	Either the HIM or I/O Terminal Block (analog input) has control of the speed reference.	380			
MOP Dec	Decrements speed reference as long as input is closed.	<u>361</u>			
MOP Inc	Increments speed reference as long as input is closed.	<u>361</u>			
MtrTrqCurRef	Torque producing current reference.	342			
Param Cntl	Parameter controlled analog output allows PLC to control analog outputs through data links. Set in [AnlgX Out Setpt], parameters 377-378.	342			
Param Cntl	Parameter controlled digital output allows PLC to control digital outputs through data links. Set in [Dig Out Setpt], parameter 379.	342			
PI Reference	Reference for PI block (see Process PI for Standard Control on page C-14).	342			
Precharge En	Forces drive into precharge state. Typically controlled by auxiliary contact on the disconnect at the DC input to the drive.	<u>361</u>			
Run Level	Provides a run level input. They do not require a transition for enable or fault, but a				
RunFwd Level	transition is still required for a stop.				
RunRev Level					
Run w/Comm	Allows the comms start bit to operate like a run with the run input on the terminal block. Ownership rules apply.				
SpdFdBk NoFilt	Provides an unfiltered value to an analog output. The filtered version "Speed Fdbk" includes a 125 ms filter.	342			
Sync Enable	The fiber feature Synchronized Speed Change has been enabled. Allows a coordinated change in drive speeds to change machine speed.	<u>622</u>			
Torque Est	Calculated percentage of rated motor torque.	342			
Traverse Enable	The Traverse function has been enabled. This adds a triangle wave and square wave modulation to the speed reference.	623 624 625 626

# **Troubleshooting**

Chapter 4 provides information to guide you in troubleshooting the PowerFlex 70. Included is a listing and description of drive faults (with possible solutions, when applicable) and alarms.

For information on	See page
Faults and Alarms	<u>4-1</u>
Drive Status	4-2
Manually Clearing Faults	<u>4-3</u>
Fault Descriptions	<u>4-3</u>
Clearing Alarms	<u>4-8</u>
Alarm Descriptions	<u>4-8</u>
Testpoint Codes and Functions	<u>4-11</u>
Common Symptoms and Corrective Actions	4-12

#### **Faults and Alarms**

A fault is a condition that stops the drive. There are three fault types.

Type	<b>Fault Description</b>	
1	Auto-Reset Run	When this type of fault occurs, and [Auto Rstrt Tries] (see page 3-35) is set to a value greater than "0," a user-configurable timer, [Auto Rstrt Delay] (see page 3-35) begins. When the timer reaches zero, the drive attempts to automatically reset the fault. If the condition that caused the fault is no longer present, the fault will be reset and the drive will be restarted. Drive must remain in Run state. If Stop is initiated, Restart function is aborted.
2	Non-Resettable	This type of fault normally requires drive or motor repair. The cause of the fault must be corrected before the fault can be cleared. The fault will be reset on power up after repair.
3	User Configurable	These faults can be enabled/disabled to annunciate or ignore a fault condition.

An alarm is a condition that, if left untreated, may stop the drive. There are two alarm types.

Type	Alarm Description					
1	User Configurable	These alarms can be enabled or disabled through				
		[Alarm Config 1] on page 3-49.				
2	Non-Configurable	These alarms are always enabled.				

4-2

#### **Drive Status**

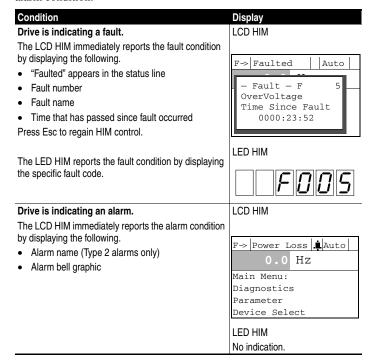

The condition or state of your drive is constantly monitored. Any changes will be indicated through the LEDs and/or the HIM (if present).

#### **LED Indications**

See page 2-3 for information on LED status indicators.

#### **HIM Indication**

The LCD and LED HIMs also provide visual notification of a fault or alarm condition.

# **Manually Clearing Faults**

# Step 1. Press Esc to acknowledge the fault. The fault information will be removed so that you can use the HIM. 2. Address the condition that caused the fault. The cause must be corrected before the fault can be cleared. 3. After corrective action has been taken, clear the fault by one of these methods. • Press Stop • Cycle drive power • Set parameter 240 [Fault Clear] to "1." • "Clear Faults" on the HIM Diagnostic menu.

#### **Fault Descriptions**

Table 4.A Fault Types, Descriptions and Actions

	1	1		_
Fault	No.	<b>Type<sup>(1)</sup></b>	Description	Action
Analog In Loss	29	1 3	An analog input is configured to fault on signal loss. A signal loss has occurred.  Configure with [Anlg In 1, 2 Loss] on page 3-56.	Check parameters.     Check for broken/loose connections at inputs.
Anlg Cal Chksum	108		The checksum read from the analog calibration data does not match the checksum calculated.	Replace drive.
Auto Rstrt Tries	33	3	Drive unsuccessfully attempted to reset a fault and resume running for the programmed number of [Flt RstRun Tries]. Enable/Disable with [Fault Config 1] on page 3-48.	Correct the cause of the fault and manually clear.
AutoTune Aborted	80		Autotune function was canceled by the user or a fault occurred.	Restart procedure.
Auxiliary Input	2	1	Auxiliary input interlock is open.	Check remote wiring.
Decel Inhibit	24	3	The drive is not following a commanded acceleration or deceleration because it is attempting to limit bus voltage.	Verify input voltage is within drive specified limits.     Verify system ground impedance follows proper grounding techniques.     Disable bus regulation and/or add dynamic brake resistor and/or extend deceleration time.
Drive OverLoad	64		Drive rating of 110% for 1 minute or 150% for 3 seconds has been exceeded.	Reduce load or extend Accel Time.

#### **4-4** Troubleshooting

Fault	No.	Type <sup>(1)</sup>	Description	Action				
Drive Powerup	49		No fault displayed. Used as a Power Up Marker in the Fault Queue indicating that the drive power has been cycled.					
Enable Hardware E C	111		Safe-Off board is not installed and pins 3 and 4 of the Safe-Off Connector are not jumpered.	Install Safe-Off board or jumper pin 3 and 4.				
			If Safe-Off board is installed, verify the hardware enable jumper is removed.	Locate and remove the enable jumper on the main control board. Refer to Chapter 1 of this manual for instructions and location.				
			Safe-Off board has failed.	Replace Safe-Off board.				
			Hardware enable circuitry failed.	Replace control board.				
Encoder Loss E C v2	91		One or both encoder channel signals is missing.	<ol> <li>Check Wiring.</li> <li>Replace encoder.</li> </ol>				
Excessive Load	79		Motor did not come up to speed in the allotted time during autotune.	<ol> <li>Uncouple load from motor.</li> <li>Repeat Autotune.</li> </ol>				
Faults Cleared E C v2	52		No fault displayed. Used as a mar the fault clear function was perform	ker in the Fault Queue indicating the med.				
Flt QueueCleared	51		No fault displayed. Used as a mar the clear queue function was perfo	ker in the Fault Queue indicating the primed.				
FluxAmpsRef Rang	78		The value for flux amps determined by the Autotune procedure exceeds the	Reprogram [Motor NP FLA] wit the correct motor nameplate value.				
		_	programmed [Motor NP FLA].	Repeat Autotune.				
Heatsink OvrTemp	8	1	Heatsink temperature exceeds 100% of [Drive Temp].	Verify that maximum ambient temperature has not been exceeded.				
				2. Check fan.				
				3. Check for excess load.				
HW OverCurrent	12	1	The drive output current has exceeded the hardware current	Check output of drive or motor f shorts.				
			limit.	2. Check programming.				
				Check for excess load, imprope DC boost setting, DC brake vol set too high or other causes of excess current.				
Incompat MCB-PB	106	2	Drive rating information stored on the power board is incompatible with the main control board.	Load compatible version files into drive.				
Input Phase Loss E C v2	17		The DC bus ripple has exceeded a preset level.	Check incoming power for a missir phase/blown fuse.				
IR Volts Range	77		"Calculate" is the autotune default and the value determined by the autotune procedure for IR Drop Volts is not in the range of acceptable values.	Re-enter motor nameplate data.				

	,							
Fault	No.	Type <sup>(1)</sup>	Description	Action				
IXo VoltageRange E C v2	87		Voltage calculated for motor inductive impedance exceeds 25% of [Motor NP Volts].	Check for proper motor sizing.     Check for correct programming of [Motor NP Volts], parameter 41.     Additional output impedance may be required.				
Load Loss E C v2	15		Drive output torque current is below [Load Loss Level] for a time period greater than [Load Loss time].	Verify connections between motor and load.     Verify level and time requirements.				
Motor OverLoad	7	① ③	Internal electronic overload trip. Enable/Disable with [Fault Config 1] on page 3-48.	An excessive motor load exists. Reduce load so drive output current does not exceed the current set by [Motor NP FLA]. If enabled, check level of flux braking in parameter P549 [Flux Braking %].				
Motor Thermistor E C	16		Thermistor output is out of range.	Verify that thermistor is connected.     Motor is overheated. Reduce load.				
Overspeed Limit	25	1	Functions such as Slip Compensation or Bus Regulation have attempted to add an output frequency adjustment greater than that programmed in [Overspeed Limit].	Remove excessive load or overhauling conditions or increase [Overspeed Limit].				
OverVoltage	5	1	DC bus voltage exceeded maximum value.	Monitor the AC line for high line voltage or transient conditions. Bus overvoltage can also be caused by motor regeneration. Extend the decel time or install dynamic brake option.				
Parameter Chksum	100	2	The checksum read from the board does not match the checksum calculated.	<ol> <li>Restore defaults.</li> <li>Reload User Set if used.</li> </ol>				
Params Defaulted	48		The drive was commanded to write default values to EEPROM.	Clear the fault or cycle power to the drive.     Program the drive parameters as needed.				
Phase U to Grnd	38		A phase to ground fault has been	Check the wiring between the				
Phase V to Grnd	39		detected between the drive and motor in this phase.	drive and motor.  2. Check motor for grounded phase.				
Phase W to Grnd	40		,	Replace drive.				
Phase UV Short	41		Excessive current has been	Check the motor and drive output				
Phase VW Short	42		detected between these two output terminals.	terminal wiring for a shorted condition.				
Phase UW Short	43			2. Replace drive.				

4-6

		Type <sup>(1)</sup>		
Fault	No.	F	Description	Action
Port 1-5 DPI Loss	81- 85		DPI port stopped communicating. A SCANport device was connected to a drive operating DPI devices at 500k baud.	If adapter was not intentionally disconnected, check wiring to the port. Replace wiring, port expander, adapters, Main Control Board or complete drive as required.
				2. Check HIM connection.
				If an adapter was intentionally disconnected and the [Logic Mask] bit for that adapter is set to "1", this fault will occur. To disable this fault, set the [Logic Mask] bit for the adapter to "0."
Port 1-5 Adapter	71- 75		The communications card has a fault.	Check DPI device event queue and corresponding fault information for the device.
Power Loss	3	① ③	DC bus voltage remained below trigger of nominal for longer than [Power Loss Time]. Enable/ Disable with [Fault Config 1] on page 3-48.	Monitor the incoming AC line for low voltage or line power interruption.
Pwr Brd Chksum1	104		The checksum read from the EEPROM does not match the checksum calculated from the EEPROM data.	Clear the fault or cycle power to the drive.
Pwr Brd Chksum2	105	2	The checksum read from the board does not match the checksum calculated.	<ol> <li>Cycle power to the drive.</li> <li>If problem persists, replace drive.</li> </ol>
Replaced MCB-PB	107	2	Main Control Board was replaced and parameters were not programmed.	<ol> <li>Restore defaults.</li> <li>Reprogram parameters.</li> </ol>
Shear Pin	63	3	Programmed [Current Lmt Val] has been exceeded. Enable/ Disable with [Fault Config 1] on page 3-48.	Check load requirements and [Current Lmt Val] setting.
SW OverCurrent	36	1	Drive output current has exceeded the 1ms current rating. This rating is greater than the 3 second current rating and less than the hardware overcurrent fault level. It is typically 200-250% of the drive continuous rating.	Check for excess load, improper DC boost setting. DC brake volts set too high.  If enabled, check level of flux braking in parameter P549 [Flux Braking %].
Trnsistr OvrTemp	9	1	Output transistors have exceeded their maximum operating temperature.	Verify that maximum ambient temperature has not been exceeded.     Check fan.     Check for excessive load.

Fault	No.	Type <sup>(1)</sup>	Description	Action
UnderVoltage	4	① ③	DC bus voltage fell below the minimum value.	Monitor the incoming AC line for low voltage or power interruption.
		•	Standard Control: 509V DC at 600V input, 407V DC at 400/ 480V input or 204V DC at 200/ 240V input.	
			Enhanced Control: 375V DC at 600V input, 300V DC at 400/480 input or 160V DC at 200/240V input.	
			Enable/Disable with [Fault Config 1] on page 3-48.	
UserSet1 Chksum	101	2	The checksum read from the	Re-save user set.
UserSet2 Chksum	102	2	user set does not match the checksum calculated.	
UserSet3 Chksum	103	2

Alarm	No.	Type <sup>(1)</sup>	Description					
Dig In	19	(2)	More than one physical input has been configured to the same input function.					
ConflictC	10	2	Multiple configurations are not allowed for the following input functions.					
			Forward/Reverse Run Reverse Bus Regulation Mode B					
			Speed Select 1 Jog Forward Acc2 / Dec2					
			Speed Select 2 Jog Reverse Accel 2					
			Speed Select 3 Run Decel 2					
			Run Forward Stop Mode B					
Drive OL	8	1	The calculated IGBT temperature requires a reduction in PWM frequency. If					
Level 1			[Drive OL Mode] is disabled and the load is not reduced, an overload fault will eventually occur.					
Drive OL	9	1	The calculated IGBT temperature requires a reduction in Current Limit. If					
Level 2			[Drive OL Mode] is disabled and the load is not reduced, an overload fault will eventually occur.					
FluxAmpsRef Rang	26	2	The calculated or measured Flux Amps value is not within the expected range. Verify motor data and rerun motor tests.					
Ground Warn	15	1	Ground current has exceeded the level set in [Gnd Warn Level].					
EC v2								
In Phase Loss E C v2	13	1	The DC bus ripple has exceeded the level in [Phase Loss Level].					
IntDBRes OvrHeat	6	1	The drive has temporarily disabled the DB regulator because the resistor temperature has exceeded a predetermined value.					
IR Volts Range	25	2	The drive auto tuning default is "Calculate" and the value calculated for IR Drop Volts is not in the range of acceptable values. This alarm should clear when all motor nameplate data is properly entered.					
IXo VoltageRange E C v2	28	2	Motor leakage inductance is out of range.					
Load Loss E C v2	14		Output torque current is below [Load Loss Level] for a time period greater than [Load Loss time].					
MaxFreq	23	2	The sum of [Maximum Speed] and [Overspeed Limit] exceeds [Maximum					
Conflict			Freq]. Raise [Maximum Freq] or lower [Maximum Speed]					
			and/or [Overspeed Limit] so that the sum is less than or equal to [Maximum Freq].					
Motor	12		[Fault Config 1] or [Alarm Config 1] Bit 7 "Motor Therm" is enabled and the					
Thermistor E C			analog Input voltage is <0.2 Volts or >5.0 Volts.					
Motor Type	21	2	[Motor Type] has been set to "Synchr Reluc" or "Synchr PM" and one or more					
Cflct			of the following exist:					
			• [Torque Perf Mode] = "Sensrls Vect," "SV Economize" or "Fan/Pmp V/Hz.					
			• [Flux Up Time] is greater than 0.0 Secs.					
			<ul> <li>[Speed Mode] is set to "Slip Comp."</li> <li>[Autotune] = "Static Tune" or "Rotate Tune."</li> </ul>					
NP Hz	22	(2)	Fan/pump mode is selected in [Torg Perf Mode] and the ratio of [Motor NP					
Conflict			Hertz] to [Maximum Freq] is greater than 26.					
Power Loss	3	1	Drive has sensed a power line loss.					

#### **4-10** Troubleshooting

		_	
Alarm	Š.	Type <sup>(1)</sup>	Description
Precharge Active	1	1	Drive is in the initial DC bus precharge state.
PTC Conflict E C	31		[Fault Config 1] or [Alarm Config 1] Bit 7 "Motor Therm" is enabled and Analog In 1 is set to milliamperes.
Sleep Config E C v2	29	2	Sleep/Wake configuration error. With [Sleep-Wake Mode] = "Direct," possible causes include: drive is stopped and [Wake Level] < [Sleep Level]. "Stop=CF," "Run," "Run Forward," or "Run Reverse." is not configured in [Digital Inx Sel].
Speed Ref Cflct	27	2	[Speed Ref x Sel] or [PI Reference Sel] is set to "Reserved".
Start At PowerUp	4	1	[Start At PowerUp] is enabled. Drive may start at any time within 10 seconds of drive powerup.
TB Man Ref Cflct E C	30		Occurs when:  "Auto/Manual" is selected (default) for [Digital In3 Sel], parameter 363 and  [TB Man Ref Sel], parameter 96 has been reprogrammed.  No other use for the selected analog input may be programmed.  Example: If [TB Man Ref Sel] is reprogrammed to "Analog In 2," all of the factory default uses for "Analog In 2" must be reprogrammed (such as parameters 90, 117, 128 and 179). See also Auto/Manual Examples on page 1-23.  To correct:  Verify/reprogram the parameters that reference an analog input or  Reprogram [Digital In3] to another function or "Unused."
UnderVoltage	2	1	The bus voltage has dropped below a predetermined value.
UserSet Conflict E C v2	51	2	[Digital Inx Sel] values differ in different user sets.
VHz Neg Slope	24	2	[Torq Perf Mode] = "Custom V/Hz" and the V/Hz slope is negative.
Waking E C v2	11	1	The Wake timer is counting toward a value that will start the drive.

<sup>(1)</sup> See page 4-1 for a description of alarm types.

<sup>(1)</sup> Use the equation below to calculate total Lifetime MegaWatt Hours.

$$\left(\frac{\text{Value of Code 9}}{\text{Value of Code 10}} \times 0.1\right) + \text{Value of Code 5} \ = \ \text{Total Lifetime MegaWatt Hours}$$

<sup>(1)</sup> Alarm numbers not listed are reserved for future use.

# **Common Symptoms and Corrective Actions**

Drive does not Start from Start or Run Inputs wired to the terminal block.

Cause(s)	Indication	Corrective Action
Drive is Faulted	Flashing red status light	Clear fault.  Press Stop  Cycle power  Set [Fault Clear] to 1 (See page 3-48)  "Clear Faults" on the HIM Diagnostic menu
Incorrect input wiring.  See page 1-17 for wiring examples.  2 wire control requires Run, Run Forward, Run Reverse or Jog input.  3 wire control requires Start and Stop inputs  Jumper from terminal 7 to 8 is required.	None	Wire inputs correctly and/or install jumper.
Incorrect digital input programming.     Mutually exclusive choices have been made (i.e., Jog and Jog Forward).     2 wire and 3 wire programming may be conflicting.     Exclusive functions (i.e, direction control) may have multiple inputs configured.     Stop is factory default and is not wired.	Flashing yellow status light and "DigIn CflctB" indication on LCD HIM. [Drive Status 2] shows type 2 alarm(s).	Program [Digital Inx Sel] for correct inputs. (See page 3-59) Start or Run programming may be missing. Program [Digital Inx Sel] to resolve conflicts. (See page 3-59) Remove multiple selections for the same function. Install stop button to apply a signal at stop terminal.

#### Drive does not Start from HIM.

Cause(s)	Indication	Corrective Action
Drive is programmed for 2 wire control. HIM Start button is disabled for 2 wire control.		If 2 wire control is required, no action is necessary.  If 3 wire control is required, program [Digital Inx Sel] for correct inputs. (See page 3-59)

#### Drive does not respond to changes in speed command.

Cause(s)	Indication	Corrective Action				
No value is coming from the source of the command.	LCD HIM Status Line indicates "At Speed" and output is 0 Hz.	If the source is an analog input, check wiring and use a meter to check for presence of signal.     Check [Commanded Freq] for correct source. (Param #002, page 3-11)				
Incorrect reference source has been programmed.	None	<ol> <li>Check [Speed Ref Source] for the source of the speed reference. (Param #213, page 3-44)</li> <li>Reprogram [Speed Ref A Sel] for correct source. (Param #090, page 3-22)</li> </ol>				
Incorrect Reference source is being selected via remote device or digital inputs.	None	<ul> <li>5. Check [Drive Status 1], bits 12 and 13 for unexpected source selections. (Param #209, page 3-42)</li> <li>6. Check [Dig In Status] to see if inputs are selecting an alternate source. (Param #216, page 3-45)</li> <li>7. Reprogram digital inputs to correct "Speed Sel x" option. (See page 3-59)</li> </ul>				

#### Motor and/or drive will not accelerate to commanded speed.

Cause(s)	Indication	Corrective Action
Acceleration time is excessive.	None	Reprogram [Accel Time x]. (See page 3-30)
Excess load or short acceleration times force the drive into current limit, slowing or stopping acceleration.	None	Check [Drive Status 2], bit 10 to see if the drive is in Current Limit. (See page 3-42) Remove excess load or reprogram [Accel Time x]. (See page 3-30)
Speed command source or value is not as expected.	None	Check for the proper Speed Command using Steps 1 through 7 above.
Programming is preventing the drive output from exceeding limiting values.	None	Check [Maximum Speed] (Param #082, page 3-20) and [Maximum Freq] (Param #055, page 3-14) to assure that speed is not limited by programming.

#### Motor operation is unstable.

Cause(s)	Indication	Corrective Action
Motor data was incorrectly entered or Autotune was not performed.	None	Correctly enter motor nameplate data.     Perform "Static" or "Rotate" Autotune procedure.     (Param #061, page 3-16)

#### **4-14** Troubleshooting

#### Drive will not reverse motor direction.

Cause(s)	Indication	Corrective Action			
Digital input is not selected for reversing control.	None	Check [Digital Inx Sel] (See page 3-59). Choose correct input and program for reversing mode.			
Digital input is incorrectly wired.	None	Check input wiring. (See page 1-16)			
Direction mode parameter is incorrectly programmed.	None	Reprogram [Direction Mode] for analog "Bipolar" or digital "Unipolar" control. (Param #190, page 3-39)			
Motor wiring is improperly phased for reverse.	None	Switch two motor leads.			
A bipolar analog speed command input is incorrectly wired or signal is	None	Use meter to check that an analog input voltage is present.			
absent.		2. Check wiring. (See page 1-17)			
		Positive voltage commands forward direction.			
		Negative voltage commands reverse direction.			

#### Stopping the drive results in a Decel Inhibit fault.

Cause(s)	Indication	Corrective Action		
The bus regulation feature is enabled and is halting deceleration due to excessive bus voltage. Excess bus voltage is normally due to excessive regenerated energy or unstable AC line input voltages. Internal timer has halted drive operation.	Decel Inhibit fault screen. LCD Status Line indicates "Faulted".	<ol> <li>See Attention statement on Preface-5.</li> <li>Reprogram bus regulation (parameters 161 and 162) to eliminate any "Adjust Freq" selection.</li> <li>Disable bus regulation (parameters 161 and 162) and add a dynamic brake.</li> <li>Correct AC input line instability or add an isolation transformer.</li> <li>Reset drive.</li> </ol>

<sup>(1)</sup> Worst case condition including HIM and Communication Module

# **Communication Configurations**

details.

#### **Typical Programmable Controller Configurations**

Important: If block transfers are programmed to continuously write information to the drive, care must be taken to properly format the block transfer. If attribute 10 is selected for the block transfer, values will be written only to RAM and will not be saved by the drive. This is the preferred attribute for continuous transfers. If attribute 9 is selected, each program scan will complete a write to the drives non-volatile memory (EEprom). Since the EEprom has a fixed number of allowed writes, continuous block transfers will quickly damage the EEprom. Do Not assign attribute 9 to

continuous block transfers. Refer to the individual communications adapter User Manual for additional

<sup>(1)</sup> A "0 = Not Stop" condition (logic 0) must first be present before a "1 = Start" condition will start the drive. The Start command acts as a momentary Start command. A "1" will start the drive, but returning to "0" will not stop the drive.

<sup>(2)</sup> This Start will not function if a digital input (parameters 361-366) is programmed for 2-Wire Control (option 7, 8 or 9).

<sup>(3)</sup> This Reference Select will not function if a digital input (parameters 361-366) is programmed for "Speed Sel 1, 2 or 3" (option 15, 16 or 17). When using the Logic Command Word for the speed reference selection, always set Bit 12, 13 or 14. Note that Reference Selection is "Exclusive Ownership" see [Reference Owner] on page 3-53.

#### Frame B

#### **Output Devices**

For information on output devices such as output contactors, cable terminators and output reactors refer to the *PowerFlex Reference Manual*, publication PFLEX-RM001.

#### **Drive, Fuse & Circuit Breaker Ratings**

The tables on the following pages provide drive ratings (including continuous, 1 minute and 3 second) and recommended AC line input fuse and circuit breaker information. Both types of short circuit protection are acceptable for UL and IEC requirements. Sizes listed are the recommended sizes <u>based on 40 degree C and the U.S. N.E.C.</u> Other country, state or local codes may require different ratings.

#### **Fusing**

If fuses are chosen as the desired protection method, refer to the recommended types listed below. If available amp ratings do not match the tables provided, the <u>closest</u> fuse rating that exceeds the drive rating should be chosen.

- IEC BS88 (British Standard) Parts 1 & 2<sup>(1)</sup>, EN60269-1, Parts 1 & 2, type gG or equivalent should be used.
- UL UL Class CC, T, RK1 or J should be used.

#### **Circuit Breakers**

The "non-fuse" listings in the following tables include both circuit breakers (inverse time or instantaneous trip) and 140M Self-Protecting Motor Starters. **If one of these is chosen as the desired protection method**, the following requirements apply.

IEC and UL – Both types of devices are acceptable for IEC and UL installations.

)	Typical designations include, but may not be limited to the following; Parts 1 & 2: AC,
	AD. BC. BD. CD. DD. ED. EFS. EF. FF. FG. GF. GG. GH.

(2) Minim	, mur	rotecti	on dev	ice siz	e is the	) lowest	rated de	evice tha	at supplie	es maxir	mum pro	tection with	Minimum protection device size is the lowest rated device that supplies maximum protection without nuisance tripping	tripping.			
(3) Maxir	mnu	protect	ion de	vice siz	ze is th	e highe:	st rated	device the	nat supp	lies driv	e protect	ion. For US	NEC, minim	um size is 125'	% of motor FL∆	. Ratings shov	Maximum protection device size is the highest rated device that supplies drive protection. For US NEC, minimum size is 125% of motor FLA. Ratings shown are maximum.

Maximum protection device size is the highest rated device that supplies drive protection. For US NEC, minimum size is 125% of motor FLA. Ratings shown are maximum.

Circuit Breaker - inverse time breaker. For US NEC, minimum size is 125% of motor FLA. Ratings shown are maximum. 4 (2)

Maximum allowable rating by US NEC. Exact size must be chosen for each installation.

Motor Circuit Protector - instantaneous trip circuit breaker. For US NEC, minimum size is 125% of motor FLA. Ratings shown are maximum.

Bulletin 140M with adjustable current range should have the current trip set to the minimum range that the device will not trip.

Manual Self-Protected (Type E) Combination Motor Controller, UL listed for 208 Wye or Delta, 240 Wye or Delta, 480Y/277 or 600Y/347. Not UL listed for use on 480V or 600V Delta/Delta systems in single motor applications.

The AIC ratings of the Bulletin 140M Motor Protector may vary. See publication 140M-SG001B-EN-P.

Notes:

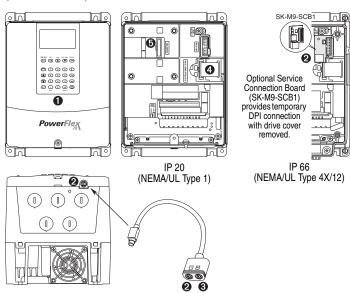

## **HIM Overview**

For information on	See page
External and Internal Connections	<u>B-1</u>
LCD Display Elements	<u>B-3</u>
ALT Functions	<u>B-3</u>

For information on	See page
Menu Structure	<u>B-4</u>
Viewing and Editing Parameters	<u>B-6</u>
Removing the HIM	<u>B-3</u>

## **External and Internal Connections**

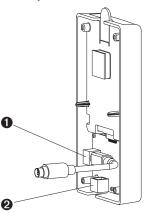

The PowerFlex 70 provides a number of cable connection points (B Frame shown).

No.	Connector	Description
0	DPI Port 1	HIM connection when installed in cover.
0	DPI Port 2	Cable connection for handheld and remote options.
8	DPI Port 3	Splitter cable connected to DPI Port 2 provides additional port.
4	Control / Power Connection	Connection between control and power boards.
•	DPI Port 5	Cable connection for communications adapter.

### Using the HIM with a 20-HIM-B1 Bezel Kit

The 20-HIM-B1 bezel kit allows remote HIM (Human Interface Module) or WIM (Wireless Interface Module) operation and provides an additional remote DPI port for accessories. The bezel cradle connection is used to mount the NEMA/UL 1 HIM or NEMA/UL 1 WIM and is designated Port 3. The accessory port on the bottom of the bezel is for standard DPI peripherals such as 1203-SSS, 1203-USB, or another handheld HIM, and is designated Port 2 (just like the accessory port on the drive). The internal connection on the back side of the bezel is used to connect the bezel to the host drive using a standard DPI cable. The 20-HIM-B1 bezel kit cannot be used with a 1203-S03 two-way splitter cable, or a 1203-SG2 two-way or 1203-SG4 four-way splitter module.

No.	Connector	Description
0	Upper DPI Port	Connects the 20-HIM-B1 bezel to the drive.
0	Lower DPI Port	Connects a 1203-SSS or 1203-USB converter to the drive.

**Important:** The bezel's lower DPI port is always Port 2 and the cradle connection port is always Port 3.

- The HIM in the bezel, set parameter 90 [Speed Ref A Sel] or parameter 93 [Speed Ref B Sel] depending on your application requirements to option 20 "DPI Port 3."
- A remote 20-HIM-C\* HIM connected directly into Port 2 on the bottom of the drive, set parameter 90 [Speed Ref A Sel] or parameter 93 [Speed Ref B Sel] to option 19 "DPI Port 2."

## **ALT Functions**

To use an ALT function, start at the Main Menu and press the ALT key, release it, then press the programming key associated with one of the following functions:

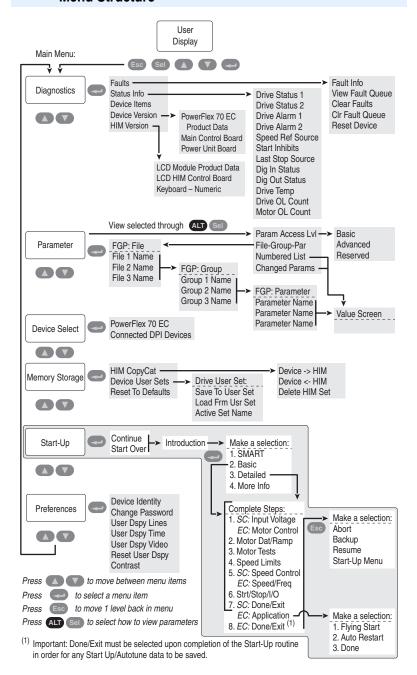

ALT Key and then			Performs this function	HIM Type
	Esc	S.M.A.R.T. Displays the S.M.A.R.T. screen.		LCD only
Esc		Log In/Out	Log in to change parameter settings. Log out to protect parameter settings. Change a password.	LED only
	Sel	View	Allows the selection of how parameters will be viewed or detailed information about a parameter or component.	LCD only
Sel Device		Device	Select a connected adapter for editing.	LED only
ALT		Lang	Displays the language selection screen.	LCD only
		Auto / Man	Switches between Auto and Manual Modes.	LCD and LED
	1	Remove	Allows HIM removal without causing a fault if the HIM is not the last controlling device and does not have Manual control of the drive.	LCD and LED
		Ехр	Allows value to be entered as an exponent. (Not available on PowerFlex 70.)	LCD only
	+/-	Param #	Allows entry of a parameter number for viewing/editing.	LCD only

## Removing the HIM

The HIM can be removed while the drive is powered. Normally, the drive issues a fault when the HIM is removed because it detects that a device is missing.

**Important:** HIM removal is only permissible in Auto mode. If the HIM is removed while in Manual mode or the HIM is the only remaining control device, a fault will occur.

### **Menu Structure**

### Diagnostics Menu

When a fault trips the drive, use this menu to access detailed data about the drive.

Option	Description
Faults	View fault queue or fault information, clear faults or reset drive.
Status Info	View parameters that display status information about the drive.
Device Version	View the firmware version and hardware series of components.
HIM Version	View the firmware version and hardware series of the HIM.

## Parameter Menu

Refer to Viewing and Editing Parameters on page B-6.

### Device Select Menu

Use this menu to access parameters in connected peripheral devices.

### Memory Storage Menu

Drive data can be saved to, or recalled from, User and HIM sets. *User sets* are files stored in permanent nonvolatile drive memory. *HIM sets* are files stored in permanent nonvolatile HIM memory.

Option	Description
HIM Copycat Device -> HIM Device <- HIM	Save data to a HIM set, load data from a HIM set to active drive memory or delete a HIM set.
Device User Sets	Save data to a User set, load data from a User set to active drive memory or name a User set.
Reset To Defaults	Restore the drive to its factory-default settings.

### Start Up Menu

See Chapter 2.

### Preferences Menu

The HIM and drive have features that you can customize.

Option	Description	
Drive Identity	Add text to identify the drive.	
Change Password	Enable/disable or modify the password.	
User Dspy Lines	Select the display, parameter, scale and text for the User Display. The User Display is two lines of user-defined data that appears when the HIM is not being used for programming.	
User Dspy Time	Set the wait time for the User Display or enable/disable it.	
User Dspy Video	Select Reverse or Normal video for the Frequency and User Display lines.	
Reset User Dspy	Return all the options for the User Display to factory default values.	

## **Viewing and Editing Parameters**

The PowerFlex 70 drive is initially set to Basic Parameter View. To view all parameters, set parameter 196 [Param Access Lvl] to option 1 "Advanced". To view Engineering parameters, set parameter 196 to option 2 "Reserved". Refer to the PowerFlex 70/700 Reference Manual, publication PFLEX-RM004 for descriptions of these parameters. Parameter 196 is not affected by the Reset to Defaults function.

### LCD HIM

St	ер	Key(s)	Example Displays
1.	In the Main Menu, press the Up Arrow or Down Arrow to scroll to "Parameter."	or 🔻	
2.	Press Enter. "FGP File" appears on the top line and the first three files appear below it.	<b>~</b>	FGP: File Monitor Motor Control
3.	Press the Up Arrow or Down Arrow to scroll through the files.	or 🔽	Speed Command
4.	Press Enter to select a file. The groups in the file are displayed under it.	<b>~</b>	FGP: Group Motor Data Torg Attributes
5.	Repeat steps 3 and 4 to select a group and then a parameter. The parameter value screen will appear.		Volts per Hertz  FGP Parameter Maximum Voltage
6.	Press Enter to edit the parameter.	<b>~</b>	Maximum Freq Compensation
7.	Press the Up Arrow or Down Arrow to scroll through the parameters. Press Sel to move the curser down to change the value. If desired, press Sel to move from digit to digit, letter to letter, or bit to bit. The digit or bit that you can change will be highlighted.	A or V	FGP: Par 55 Maximum Freq 130.00 Hz [ALT] [VIEW] -> Limits
8.	Press Enter to save the value. If you want to cancel a change, press Esc.	<b>~</b>	FGP: Par 55
9.	Press the Up Arrow or Down Arrow to scroll through the parameters in the group, or press Esc to return to the group list.	▲ or ▼	FGP: Par 55  Maximum Freq 90.00 Hz [ALT] [VIEW] -> Limits

### **Numeric Keypad Shortcut**

If using a HIM with a numeric keypad, press the ALT key and the +/- key to access the parameter by typing its number.

## **External Brake Resistor**

Figure C.1 External Brake Resistor Circuitry

## Skip Frequency

Figure C.2 Skip Frequency

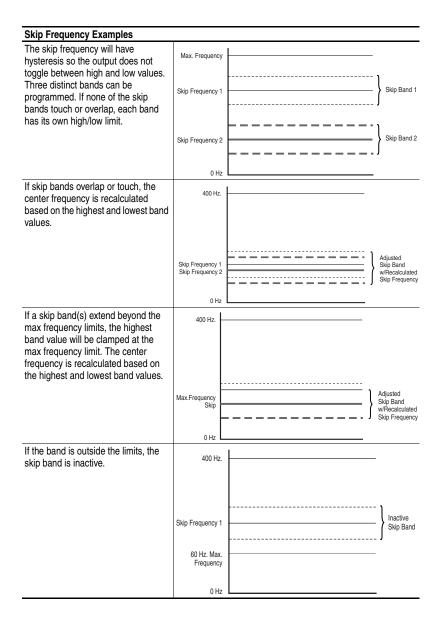

Some machinery may have a resonant operating frequency that must be avoided to minimize the risk of equipment damage. To assure that the motor cannot continuously operate at one or more of the points, skip frequencies are used. Parameters 084-086, ([Skip Frequency 1-3]) are available to set the frequencies to be avoided.

The value programmed into the skip frequency parameters sets the center point for an entire "skip band" of frequencies. The width of the band (range of frequency around the center point) is determined by parameter 87, [Skip Freq Band]. The range is split, half above and half below the skip frequency parameter.

If the commanded frequency of the drive is greater than or equal to the skip (center) frequency and less than or equal to the high value of the band (skip plus 1/2 band), the drive will set the output frequency to the high value of the band. See (A) in Figure C.2.

If the commanded frequency is less than the skip (center) frequency and greater than or equal to the low value of the band (skip minus 1/2 band), the drive will set the output frequency to the low value of the band. See (B) in Figure C.2.

Acceleration and deceleration are not affected by the skip frequencies. Normal accel/decel will proceed through the band once the commanded frequency is greater than the skip frequency. See (A) & (B) in Figure C.2. This function affects only continuous operation within the band.

## Stop Modes

Several methods are available for braking or stopping a load as described in the table below.

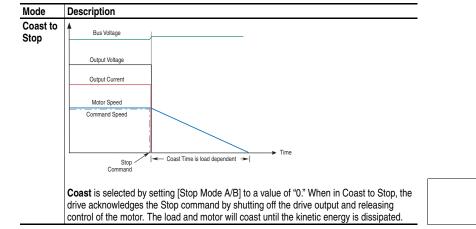

Method	Use When Application Requires	Braking Power
Ramp	<ul> <li>The fastest stopping time or fastest ramp time for speed changes (external brake resistor or regenerative capability required for ramp times faster than the methods below).</li> </ul>	Most, if an external resistor or regenerative
	<ul> <li>High duty cycles, frequent stops or speed changes. (The other methods may result in excessive motor heating).</li> </ul>	device is connected.
Fast Brake	<ul> <li>Additional braking capability without use of an external brake resistor or regenerative unit, but only effective during stop events, not speed changes.</li> </ul>	More than Flux Braking or DC Brake
	Important: For this feature to function properly the active Bus Reg Mode A or B must be set to Adjust "Freq" and NOT be "Disabled".	
Flux Braking	In some applications, Flux Braking can provide a method for fast speed changes or stops. It is not suitable for high inertia loads or high duty cycle operation for applications greater than 1 cycle per minute. This feature supplies additional flux current to the motor and can cause motor thermistor or overvoltage faults in the drive.	More than DC Brake
	Fast speed changes and fast stopping time.	
	<ul> <li>Typical stop from speeds below 50% of base speed ("Flux Braking" will likely stop the load faster than "Fast Brake" in this case).</li> </ul>	
	Important: This can be used in conjunction with "Ramp" or "Ramp to Hold" for additional braking power or with "Fast Brake" or "DC Brake" for speed changes.	
	Important: For this feature to function properly the active Bus Reg Mode A or B must be set to Adjust "Freq" and NOT be "Disabled".	
DC Brake	Additional braking capability without use of external brake resistor or regenerative units.	Less than above methods

In addition to these modes, the drive can be programmed for "Coast" and "Ramp to Hold," which are described in further detail in this section.

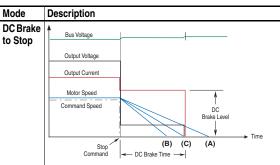

### Configuration

- [Stop/Brk Mode A], parameter 155
- [Stop/Brk Mode B], parameter 156
  - 0 = Coast
  - 1 = Ramp
  - 2 = Ramp to Hold
  - 3 = DC Brake
  - 4 = Fast Brake (PowerFlex 70 & 700 Only)
- [DC Brk Lvl Sel], parameter 157
  - 0 = "DC Brake Lvl" selects parameter 158 as the source for the DC brake level
  - 1 = "Analog in 1"
  - 2 = "Analog in 2"
- [DC Brake Level], parameter 158 sets the DC brake level in amps, when parameter 157 = "DC Brake Lvl"
- [DC Brake Time], parameter 159 sets the amount of time that DC braking is applied after the ramp (if any).
- [Flux Braking], parameter 166 may need to adjust parameter 549
  - 0 = Disabled, 1 = Enabled
- [Digital InX Sel], parameters 361-366
  - 13 = "Stop Mode B" setting a digital input to this function allows the use of a digital input to switch between Stop Mode A (open input) and Stop Mode B (closed input).

### **Detailed Operation**

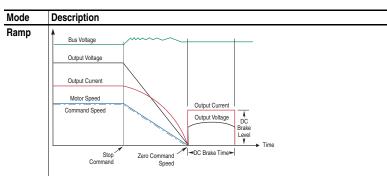

Mode

This method uses DC injection of the motor to Stop and/or hold the load. DC Brake is selected by setting [Stop Mode A/B] to a value of "3." The amount of time that braking will be applied is programmed in [DC Brake Time] and the magnitude of the current used for braking is programmed in and [DC Brake Level]. This mode of braking will generate up to 40% of rated motor torque for braking and is typically used for low inertia loads with infrequent Stop cycles.

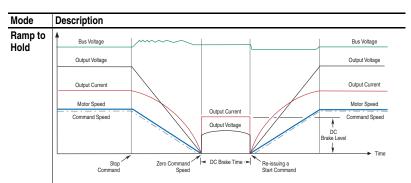

- 1. On Stop, 3 phase drive output goes to zero (off)
- 2. Drive outputs DC voltage on the last used phase at the level programmed in [DC Brake Level], parameter 158. This voltage causes a "stopping" brake torque. If the voltage is applied for a time that is longer than the actual possible stopping time, the remaining time will be used to attempt to hold the motor at zero speed (decel profile "B" on the diagram above).
- 3. DC voltage to the motor continues for the amount of time programmed in [DC Brake Time], parameter 159. Braking ceases after this time expires.
- 4. After the DC Braking ceases, no further power is supplied to the motor. The motor/load may or may not be stopped. The drive has released control of the motor/load (decel profile "A" on the diagram above).
- 5. The motor, if rotating, will coast from its present speed for a time that is dependent on the remaining kinetic energy and the mechanics of the system (inertia, friction, etc.).
- 6. Excess motor current and/or applied duration, could cause motor damage. The user is also cautioned that motor voltage can exist long after the Stop command is issued. The right combination of Brake Level and Brake Time must be determined to provide the safest, most efficient stop (decel profile "C" on the diagram above)

This method uses drive output reduction to stop the load. Ramp is selected by setting [Stop Mode A/B] to a value of "1". The drive will ramp the frequency to zero based on the deceleration time programmed into [Decel Time 1/2]. The "normal" mode of machine operation can utilize [Decel Time 1]. If the machine "stop" requires a faster deceleration than desired for normal deceleration, [Decel Time 2] can be activated with a faster rate selected. When in Ramp mode, the drive acknowledges the stop command by decreasing or "ramping" the output voltage and frequency to zero in a programmed period (Decel Time), maintaining control of the motor until the drive output reaches zero. The drive output is then shut off. The load and motor should follow the decel ramp. Other factors such as bus regulation and current limit can alter the actual decal rate.

Ramp mode can also include a "timed" hold brake. Once the drive has reached zero output hertz on a Ramp-to-Stop and both parameters [DC Brake Time] and [DC Brake Level] are not zero, the drive applies DC to the motor producing current at the DC Brake Level for the DC Brake Time.

- On Stop, drive output will decrease according to the programmed pattern from its
  present value to zero. The pattern may be linear or squared. The output will decrease
  to zero at the rate determined by the programmed [Maximum Freq] and the
  programmed active [Decel Time x].
- 2. The reduction in output can be limited by other drive factors such as bus or current regulation.
- 3. When the output reaches zero the output is shut off.
- 4. The motor, if rotating, will coast from its present speed for a time that is dependent on the mechanics of the system (inertia, friction, etc.).

This method combines two of the methods above. It uses drive output reduction to stop the load and DC injection to hold the load at zero speed once it has stopped.

- On Stop, drive output will decrease according to the programmed pattern from its
  present value to zero. The pattern may be linear or squared. The output will decrease
  to zero at the rate determined by the programmed [Maximum Freq] and the
  programmed active [Decel Time x].
- The reduction in output can be limited by other drive factors such as bus or current regulation.
- When the output reaches zero, 3 phase drive output goes to zero (off) and the drive outputs DC voltage on the last used phase at the level programmed in [DC Brake Level], parameter 158. This voltage causes a "holding" brake torque.
- DC voltage to the motor continues until a Start command is reissued or the drive is disabled.
- If a Start command is reissued, DC Braking ceases and the drive returns to normal AC operation. If an Enable command is removed, the drive enters a "not ready" state until the enable is restored.

Mode Description Fast Bus Voltage ····· **Brake** Output Voltage Output Current Motor Speed Command Speed Stop Command This method takes advantage of the characteristic of the induction motor whereby frequencies greater than zero (DC braking) can be applied to a spinning motor that will provide more braking torque without causing the drive to regenerate. 1. On Stop, the drive output will decrease based on the motor speed, keeping the motor out of the regen region. This is accomplished by lowering the output frequency below the motor speed where regeneration will not occur. This causes excess energy to be lost in the motor. 2. The method uses a PI based bus regulator to regulate the bus voltage to a reference (e.g. 750V) by automatically decreasing output frequency at the proper rate. 3. When the frequency is decreased to a point where the motor no longer causes the bus voltage to increase, the frequency is forced to zero. DC brake will be used to complete the stop if the DC Braking Time is non-zero, then the output is shut off. 4. Use of the current regulator ensures that over current trips don't occur and allow for an easily adjustable and controllable level of braking torque. 5. Use of the bus voltage regulator results in a smooth, continuous control of the

frequency and forces the maximum allowable braking torque to be utilized at all times.

6. Important: For this feature to function properly the active Bus Reg Mode A or B must

be set to Adjust "Freq" and NOT be "Disabled".

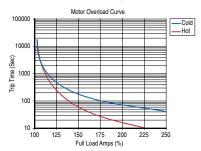

### **Motor Overload**

For single motor applications the drive can be programmed to protect the motor from overload conditions. An electronic thermal overload I<sup>2</sup>T function emulates a thermal overload relay. This operation is based on three parameters; [Motor NP FLA], [Motor OL Factor] and [Motor OL Hertz] (parameters 042, 048 and 047, respectively).

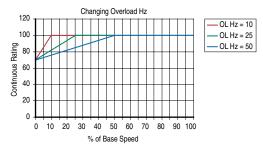

[Motor NP FLA] is multiplied by [Motor OL Factor] to allow the user to define the continuous level of current allowed by the motor thermal overload. [Motor OL Hertz] is used to allow the user to adjust the frequency below which the motor overload is derated.

The motor can operate up to 102% of FLA continuously. If the drive had just been activated, it will run at 150% of FLA for 180 seconds. If the motor had been operating at 100% for over 30 minutes, the drive will run at 150% of FLA for 60 seconds. These values assume the drive is operating above [Motor OL Hertz], and that [Motor OL Factor] is set to 1.00.

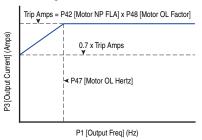

Operation below 100% current causes the temperature calculation to account for motor cooling.

[Motor OL Hertz] defines the frequency where motor overload capacity derate should begin. The motor overload capacity is reduced when operating below [Motor OL Hertz]. For all settings of [Motor OL Hertz] other than zero, the overload capacity is reduced to 70% at an output frequency of zero.

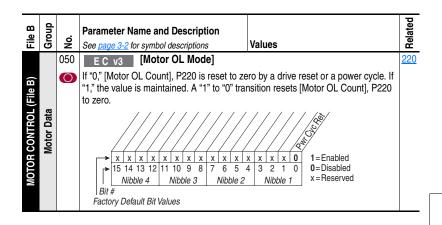

[Motor NP FLA] is multiplied by [Motor OL Factor] to select the rated current for the motor thermal overload. This can be used to raise or lower the level of current that will cause the motor thermal overload to trip. The effective overload factor is a combination of [Motor OL Hertz] and [Motor OL Factor].

The motor overload, if enabled, allows continuous operation at or below the line. Above the line, the overload will trip after a time delay. The further above the line, the shorter the trip time.

## **Motor Overload Memory Retention Per 2005 NEC**

The PowerFlex 70 EC (Firmware Revision 3.002 or greater) has the ability to retain the motor overload count at power down per the 2005 NEC motor overtemp requirement. A parameter has been added to provide this functionality. To Enable/Disable this feature, refer to the information below.

## Start At PowerUp

When Start At Powerup in 2 wire control is configured, the drive will start if all start permissive conditions are met (within 10 seconds of drive power being applied), and the terminal block start input (Run, Run Forward or Run Reverse for 2-wire) is closed. An alarm will be annunciated from application of power until the drive actually starts, indicating the powerup start attempt is in progress.

The powerup start attempt will be aborted if any of the following occurs anytime during the 10-second start interval:

- A fault condition occurs
- A Type 2 alarm condition occurs
- The terminal block programmed enable input is opened
- All terminal block run, run forward, or run reverse, inputs are canceled
- A Stop request (from any source) is received

If the drive has not started within the 10 second interval, the powerup start attempt will be terminated.

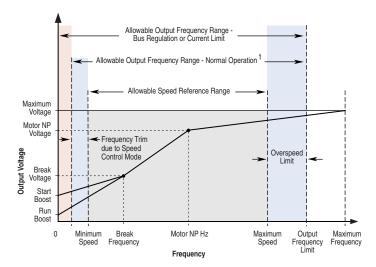

### Overspeed

Overspeed Limit is a user programmable value that allows operation at maximum speed, but also provides an "overspeed band" that will allow a speed regulator such as encoder feedback or slip compensation to increase the output frequency above maximum speed in order to maintain maximum motor speed.

The figure below illustrates a typical Custom V/Hz profile. Minimum Speed is entered in Hertz and determines the lower speed reference limit during normal operation. Maximum Speed is entered in Hertz and determines the upper speed reference limit. The two "Speed" parameters only limit the speed reference and not the output frequency.

The actual output frequency at maximum speed reference is the sum of the speed reference plus "speed adder" components from functions such as slip compensation.

The Overspeed Limit is entered in Hertz and added to Maximum Speed and the sum of the two (Speed Limit) limit the output frequency. This sum (Speed Limit) must is compared to Maximum Frequency and an alarm is initiated which prevents operation if the Speed Limit exceeds Maximum Frequency.

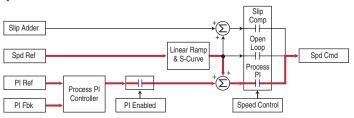

Note 1: The lower limit on this range can be 0 depending on the value of Speed Adder

### **Process PI for Standard Control**

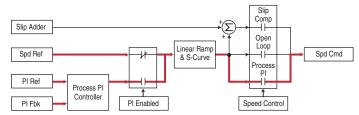

The internal PI function of the PowerFlex 70 provides closed loop process control with proportional and integral control action. The function is designed for use in applications that require simple control of a process without external control devices. The PI function allows the microprocessor of the drive to follow a single process control loop.

The PI function reads a process variable input to the drive and compares it to a desired setpoint stored in the drive. The algorithm will then adjust the output of the PI regulator, changing drive output frequency to try and make the process variable equal the setpoint.

It can operate as trim mode by summing the PI loop output with a master speed reference.

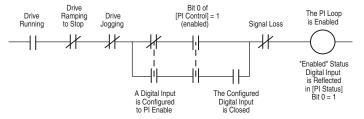

Or, it can operate as control mode by supplying the entire speed reference. This method is identified as "exclusive mode"

### PI Enable

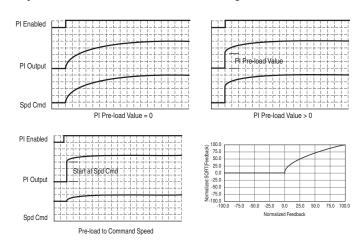

The output of the PI loop can be turned on (enabled) or turned off (disabled). This control allows the user to determine when the PI loop is providing part or all of the commanded speed. The logic for enabling the PI loop is shown in below.

The drive must be running for the PI loop to be enabled. The loop will be disabled when the drive is ramping to a stop, jogging or the signal loss protection for the analog input(s) is sensing a loss of signal.

If a digital input has been configured to "PI Enable," two events are required to enable the loop: the digital input must be closed AND bit 0 of the PI Control parameter must be = 1.

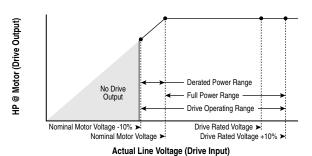

If no digital input is configured to "PI Enable," then only the Bit 0 = 1 condition must be met. If the bit is permanently set to a "1", then the loop will become enabled as soon as the drive goes into "run".

## **Voltage Tolerance**

Drive Rating	Nominal Line Voltage	Nominal Motor Voltage	Drive Full Power Range	Drive Operating Range
200-240	200	200†	200-264	180-264
	208	208	208-264	
	240	230	230-264	
380-400	380	380†	380-528	342-528
	400	400	400-528	
	480	460	460-528	
500-600	600	575†	575-660	432-660

Drive Full Power Range =	Nominal Motor Voltage to Drive Rated Voltage + 10%. Rated current is available across the entire Drive Full Power Range
Drive Operating Range =	Lowest† Nominal Motor Voltage - 10% to Drive Rated Voltage + 10%. Drive Output is linearly derated when Actual Line Voltage is less than the Nominal Motor Voltage

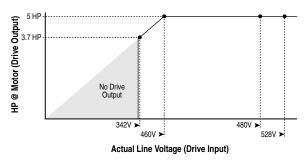

### **Example:**

Calculate the maximum power of a 5 HP, 460V motor connected to a 480V rated drive supplied with 342V Actual Line Voltage input.

- Actual Line Voltage / Nominal Motor Voltage = 74.3%
- 74.3% × 5 HP = 3.7 HP
- 74.3% × 60 Hz = 44.6 Hz

At 342V Actual Line Voltage, the maximum power the 5 HP, 460V motor can produce is 3.7 HP at 44.6 Hz.

# Artisan Technology Group is an independent supplier of quality pre-owned equipment

## **Gold-standard solutions**

Extend the life of your critical industrial, commercial, and military systems with our superior service and support.

## We buy equipment

Planning to upgrade your current equipment? Have surplus equipment taking up shelf space? We'll give it a new home.

### Learn more!

Visit us at artisantg.com for more info on price quotes, drivers, technical specifications, manuals, and documentation.

Artisan Scientific Corporation dba Artisan Technology Group is not an affiliate, representative, or authorized distributor for any manufacturer listed herein.
