\*Omniline automatically accepts all primary voltages from 220-632VAC 3Ø. The unit is inoperable when connected to voltages outside this range.

\*\*Input amperage for full rated output @ 30% duty cycle.

\*\*\*Input amperage for rated output @ 100% duty cycle.

Note: For 230VAC 1Ø maximum output current is limited by input current, not by thermal limitations.

# GENERAL INFORMATION

## DESCRIPTION OF EQUIPMENT

The PowCon 300SE is a portable welding power source designed primarily for STICK (SMAW) welding and TIG (GTAW) welding. A LiftArc™ starting feature is provided for smooth easy GTAW starts. Arc Force adjustment is provided for SMAW. The 300SE is also capable of performing carbon arc gouging and Flux Cored welding with an appropriate arc voltage sensing wire feeder.

The 300SE is equipped with Fan On Demand, so the cooling fan runs only when needed. This reduces ingestion of dirt, dust, and moisture, which can affect their performance and life of internal electrical parts in sufficient amounts. The 300SE (if provided with the *OmniLine*™ input voltage feature) can operate from 230, 240, 380, 400, 415, 460, 480, 500, and 575 volt, Single or Three phase inputs. The *OmniLine*™ feature automatically configures itself to the input voltage applied, without operator intervention.

## THEORY OF OPERATION

Input power to the 300SE *OmniLine* is applied through an On/Off switch, S1, located on the front panel. The switch, S1, is a Three Pole Single Throw (3PST) switch. In the "On" position, S1 provides input power to two components, i.e., The Auxiliary Power Board and the Capacitor Filter (CF assembly) board assembly on the *OmniLine* Version.

The Auxiliary Power board assembly uses this voltage for two functions. The first function is to sample the input voltage and automatically connect the taps of the auxiliary (control) transformer to the appropriate voltage. This happens within the first two to three seconds after the switch is turned "On."

The second function is to provide auxiliary voltage to other components once the changeover on the auxiliary

transformer has been completed. These voltages are: 48VAC/24VAC Center Tapped (CT) to the control board assembly, auxiliary AC voltage to the remote connector for use with Wire Feeders or other accessories, and 18VDC to the *OmniLine* Regulator Circuitry.

The input power provided to the CF assembly is important to pre-charge the DC Link Capacitors. The AC power is being rectified by the CF assembly in the normal means, with one exception. The power is routed through two 50 resistors, which charge the DC Link Capacitors slowly, preventing high inrush currents, that could damage input diodes and DC Link Capacitors, and high voltage spikes, that could damage the IGBT's in the PWM assembly.

Once the Control board assembly receives the correct input power necessary to run the control logic systems and the fan, an Input Contactor Relay energizes, which provides full 3 AC power to the CF assembly, by-passes the 50 resistors.

The CF assembly is considered a Full-Wave Bridge rectifier. The DC voltage (also called the "DC Buss") rectified by the CF assembly can be expressed by the following formula and examples:

Formula:

$$\text{AC Input Voltage (rms)} \times 1.414 = \text{DC Buss Voltage}$$

Example:

$$230\text{VAC} \times 1.414 = 325\text{VDC}$$

$$400\text{VAC} \times 1.414 = 566\text{VDC}$$

The *OmniLine* Regulator circuit increases the DC Buss voltage to approximately 800VDC. The main advantage using a boost circuit is eliminating voltage changeover links inside the unit, allowing it to be connected to any input AC voltage of 230V, 400V, 460V and 575VAC, 10%.

(1) 3~		S

Figure 1 - Power Input and Output

# GENERAL INFORMATION

The boost converter regulates the DC Link voltage to 800VDC regardless of the input voltage to the boost converter, which can range from 300VDC to 800VDC.

The DC Link voltage created by the Boost Converter supplies power directly to the main welding converter. This converter is operated using two IGBT's. The IGBT's are turned "On" and "Off" alternately, creating an AC voltage through the Main and 5-P transformers (for clarity, consider these transformers the main transformer, until indicated otherwise) to charge and discharge the working capacitors, which are located on the PWM Driver IGBT board.

The frequency of the inverter remains constant regardless of the output power level the operator requires, operating at a frequency of 32KHz. To vary the output power level of the power source, the inverter changes the "On" time of the IGBT's compared to the "Off" time. The greater the "On" time, the greater the output power level. Likewise, if the IGBT's "On" time decreases, the output power level will also decrease. By controlling the "On" time, we are controlling the Pulse's "Width," hence Pulse Width Modulation.

One advantage of higher frequency alternating current is a significantly reduced main transformer size. The PowCon main transformer size and weight are approximately 6 inches square and 10 pounds, compared to a conventional power source's main transformer, ranging up to 2 feet square and weighing 200 pounds. The main transformer takes the higher voltage, low current power from the IGBT's on the primary and transforms it to a lower voltage, high current power on the secondary appropriate for welding processes.

The secondary AC voltage of the main and 5-P transformers are rectified by 4 diodes, two for the main transformer carrying 95 percent of the output welding current, and two for the 5-P transformer carrying the remaining 5 percent of the welding output current. The output rectifier is considered a half bridge rectifier, using the center tap of the main and 5-P transformers as the negative output jack. After the output rectifier, the output current is filtered (smoothed) by an inductor (with an additional winding on it to provide timing feedback to the control board) and the voltage is filtered by Resistor/Capacitor (RC) networks. For current feedback used in current regulation of the welding output and proper pulsed width modulation (PWM) of the IGBT's, there are two current transformers mounted on the secondary leads of the main and 5-P transformers.

The complete sequence of operation is regulated by the main control board through control logic feedback. Additionally, the main control board regulates the amount of time the fan is on. The main control board allows the fan to run when initial power is applied, eliminating moisture which could have accumulated overnight, for example, and while welding, preventing a considerable amount of metal dust, dirt, etc., from entering the power source. The fan's "On" time directly depends on welding time and output settings.

# INSTALLATION

## INSTALLATION

### UNPACKING NEW EQUIPMENT

(Receiving and Handling)

Remove the PowCon Welding Power Source from its shipping carton and inspect for any possible damage that might have occurred during shipping. Make sure that all items on the packing list are accounted for and identified. One copy of the PowCon 300SE Operation Manual is packed with each PowCon 300SE unit.

Any claims for loss or damage that may have occurred in transit must be filed by the PURCHASER with the CARRIER. Copies of the bill of lading and freight bill will be furnished by the carrier on request, if the need to file a claim arises. When requesting information concerning this equipment, it is essential that model description, serial number and/or part number of the equipment be supplied.

#### NOTE

To assure a valid warranty, you **MUST** complete and return the warranty card (enclosed with all products) within 10 days of the purchase date.

### EQUIPMENT INSTALLATION

#### Input Power Requirements

The primary cable supplied with the power source has four conductors. When connecting an attachment plug or hard-wiring to an electrical service box, connect the green/yellow wire to the GROUND or the protective earth connector. The other three conductors can be connected to the phases in any order.

For Single Phase operation do not connect the blue wire. Simply tie it back and insulate from all else. (See Figure 5)

#### NOTE

Always make the installation in accordance with your plant regulations and applicable electrical code.

### FUSE SIZE

Table 1 - Recommended Fuse Size\*

Input Voltage	Continuous Amperage	Recommended Fuse Capacity
230, 1ø	30A	60A
230, 3ø	18A	50A
380, 400, 415, 3ø	11A	30A
460, 1ø	15A	40A
460, 3ø	9A	30A
575, 3ø	8A	20A

\*Continuous current demand is based on an output of 28VDC and 200 amps for 3 phase input.

#### WARNING

Do not allow the unit to remain operating when lifting or moving it. Do not drag or lift the unit by primary or secondary cable.

#### DANGER

Exercise care in the handling of primary and secondary cable to avoid wearing out or loss of electrical insulation.

Do not lift the unit unless all 10 flange screws and nuts holding the top and bottom cases are tight.

#### NOTE

Locate the PowCon unit so the airflow into the front and out of the back of the unit is not obstructed.
