PMC410

Specifications & Ordering

The PMC410 Display/Switch module provides direct event/status display combined with a input mechanism for localized operator control.

LED Display

Sixteen, independently controlled Light Emitting Diode (LED) units provide a flexible solution for indicating status and operator alerts. Arranged as two rows of 8 units, the LEDs may be ordered either as all Green, or a combination of Red, Green and Yellow. LED state (i.e. on/off) is controlled from host software via a very simple interface. Current status of each LED can be read to simplify control software. Each LED is separately controlled; any display output may be created

Rotary Switch Input

A frequent requirement in many applications is a mechanism for local configuration and/or identification. The PMC410 provides this with two, sixteen position rotary switches. The current value of the switch is read as a single, eight bit value.

Software Drivers

RAMiX provides support for the PMC410 under most real time software environments. This software support, combined with the industry standard PMC specification makes integration of the PMC410 extremely simple from both hardware a and software perspective.
