WARRANTY

Colorado Data Systems, Inc. (CDS) products (hardware and firmware) are warranted against defects in materials and workmanship, and are warranted to meet the performance specifications as listed in the current catalog and/or data sheet for the specific product being warranted. This warranty applies for **three (3) years** following the date of shipment. CDS will, at its option, repair or replace, at no cost to the customer, products which prove to be defective during the warranty period, provided the defect or failure is not due to misuse or abuse of the product. The customer is responsible for shipment of the defective product to the CDS factory. Software products are supplied on a site license basis subject to the same performance warranty provisions; the materials and distribution provision applies to the distribution media only. NO OTHER WARRANTY IS EXPRESSED OR IMPLIED, INCLUDING WARRANTY FOR FITNESS OF PURPOSE. CDS SHALL, IN NO CASE, BE LIABLE FOR CONSEQUENTIAL DAMAGES.

53A-333 REED RELAY SCANNER CARD

DESCRIPTION

The 53A-333 Reed Relay Scanner Card is a printed circuit board assembly for use in a CDS 53/63 System. The 53A-333 Card provides fifteen 3-wire channels of analog signal acquisition, and routes any one of fifteen input channels to a common bus at a switching rate of 150 channels per second. A channel can be randomly selected (closed) by transmitting ASCII characters from the system controller to the 53/63 System.

Up to ten 53A-333 Cards can be plugged into a single 53A-002 Card Cage or up to five 53A-333 Cards can be plugged into a 63A-012 Card Cage to provide scanning of up to 150 or 75 channels, respectively. As many as ten 53A-002 or 63A-012 Card Cages can be chained together to provide a system with up to fifteen hundred (using 53A-002 Card Cages) or seven hundred fifty (using 63A-012 Card Cages) 3-wire input channels. If desired, 53A-331 (ten 4-wire channels), 53A-334 (thirty-two 1-wire channels), 53A-332 (twenty 2-wire channels) Reed Relay Scanner Cards or 53A-336 (sixteen 2-wire channels) High Voltage Scanner Cads can be mixed with 53A-333 Cards in the same card cage.

Diagnostics include indicator LEDs and a readback feature that returns a two-digit number to the system controller indicating the number of the closed channel. The readback feature uses a fourth pole on each relay to test all 53A-333 Card circuitry including the relay coils. If there is more than one relay closed at the same time, an error code is generated.

CONTROLS AND INDICATORS

The following controls and indicators are provided to select and display the functions of the 53A-333 Card's operating environment.

Address-Select Switch

The 53A-333 Card has a miniature 10-position switch labeled "ADDRESS" that selects the 53A-333 Card's address (0-9) in the 53/63 System. The switch's cover opens to allow the address to be reselected. A screwdriver with a narrow, flat blade should be used to turn the cam-action wiper to the desired address position.

Power LED

The Power LED provides a valuable diagnostic tool by giving the system programmer a visual indication of the action which the system is currently taking. Whenever the 53A-333 Card is addressed by the system controller, the Power LED goes out. The LED remains out until another function card is addressed. Since only one function card can be addressed at a time, an unlit Power LED indicates the function card with which the system controller is currently communicating. The Power LED being lit not only indicates that the 53A-333 Card is unaddressed, but that all required dc power (5V dc, ±15V dc) is being supplied.

Fuse

The 5V DC power bus has a fuse that protects the system from overloads. If the fuse has blown, the Power LED will not light.

Function LEDS and Switches

LEDs

The following LEDs are provided at the top front edge of the 53A-333 Card to indicate the status of the card's operation:

Channel LEDs

The column of 12 LEDs near the front-edge connector indicate the specific scanner channel closed. If the closed channel is between 0 and 9, the "0X" LED and one of the LEDs marked "0" through "9" is lit; if the closed channel is between 10 and 14, the "1X" LED and one of the LEDs marked "0" through "4" is lit. Any other combination indicates an error.

Switches

The following switches are provided to select the proper functions for the 53A-333 Card's operating environment:

Scan Clear Switch

At the rear of the 53A-333 Card is a 1-section rocker switch that determines if the card is to open all its channels when a channel is closed on another scanner card (53A-331, 53A-332, 53A,333, 53A-334, 53A-336):

Rocker Setting	Results
C1	a. A closed channel on this card is opened when a channel is closed on another scanner card.
	b. Closing a channel on this card sends a "clear" pulse to all other scanner cards.
C2	a. Closing channels on other scanner cards has no effect on this card.
	b. When a channel is closed on this card, a "clear" pulse is not sent to other scanner cards.

Analog Bus Switch

At the bottom front center of the 53A-333 Card is a 2-section rocker switch that connects the common output lines (Common High, Low, and Guard) of the scanner to the analog backplane bus (Backplane High, Low, and Guard) of the 53A-002/63A-012 Card Cage:

Rocker Setting	Results
C1, C4	Common High, Low, Guard are connected to Backplane High, Low, and Guard, respectively.
C1, C3	Common High and Low are connected to Backplane High and Low, respectively. Common Guard is disconnected from the analog backplane bus.
C2, C4	Common Guard is connected to Backplane Guard. Common High and Low are disconnected from the analog backplane bus.
C2, C3	Common High, Low, and Guard are disconnected from the analog backplane bus.

Bus Resistance Switch

At the bottom rear center of the 53A-333 Card is a 2-section rocker switch which may be used to connect 1-megohm resistors from Common High to ground, from Common Low to Ground or from Common Guard to ground of the 53/63 System. When high voltages are being switched by the card, the resistors can be switched in and used to discharge the backplane analog bus between scanner channel closings so that the maximum switching voltage specifications of the card are not exceeded. See Appendix C for applications information on using this switch.

Rocker Settings	Results
C1, C3	Disconnect 1-megohm resistors from the scanner common bus.
C2, C4	Connect 1-megohm resistors between Common High, Common Low, Common Guard and Ground.
C1, C4	Connect 1-megohm resistor between Common Guard and Ground only.
C2, C3	Connect 1-megohm resistors between Common High, Common Low and Ground only.

SPECIFICATIONS

Configuration:	15-channel, 3-wire scanner.
Relay Type:	4-pole, form A (3 poles for 3-wire scanner; 1 pole for self-test).
Relay Manufacturer:	Coto - model 7004-5054 or equivalent.
Contacts:	
Maximum Switching Power (resistive):	10W.
Maximum Switching Voltage:	200V DC (see Appendix C). 130V AC RMS, balanced input. 75V AC RMS, one side grounded. 90V AC RMS, one side grounded. * * Maximum voltage with S95 switch in the C2, C4 position.
Maximum Switching Current:	0.5 amps.
Initial Contact Resistance:	Less than 150 milliohms (dry circuit). Less than 200 milliohms (1.5 milliseconds or more after coil energized, 0.5V at 50mA).
Final Contact Resistance (End of Reed Life):	Less than 1 ohm.
Dielectric Strength:	250V (between contacts).
Reed Life:	10^8 operations/channel at 1V DC/1V p-p at less than 10 mA (dry circuit). 10^7 ops/channel - 30V DC/30V p-p at 300 mA. 10^6 ops/channel - 20V DC/20V p-p at 500 mA.
Duty:	Continuous.
Scanning Rate:	Random channels selected at greater than 150 channels per second.
Signal Path Specifications:	These specifications include the effects of the card cage backplane; they are valid at the analog output connector on the backplane:
Differential Thermal Offset:	Less than 10 µV.
Single-Line Thermal Offset:	Less than 40 µV.
Initial Signal Path Resistance:	Less than 400 milliohms.

Final Signal Path Resistance (End of Reed Life):	Less than 1.4 ohms.
Insulation Resistance:	Greater than 10 gigohms between all insulated parts.
Crosstalk Between Channels:	1 kHz - less than -90 dB. 10 kHz - less than -80 dB. 100 kHz - less than -62 dB. 1 MHz - less than -56 dB. Crosstalk measurements are made at the common output with a closed channel terminated by 600 ohms; signal is applied to channels not selected.
Power-Up:	On power-up, the 53A-333 Card is unaddressed (power LED lit), and all channels are open (channel LEDs out).
Power-Down:	On power-down, the 53A-333 Card has all channels open (channel LEDs out).
Power Requirements:	5V DC from the 53A-060 power supply in the 53A-002 Card Cage, and the 63A-070 power supply in the 63A-012 Card Cage.
Voltage:	4.57V DC to 5.25V DC.
Current:	0.80 A max. quiescent. 0.85 A peak.
Cooling:	Provided by the fan in the 53/63 Card Cage.
Temperature:	-10 °C to +65 °C, operating (assumes ambient temperature of 55 ° and airflow to assure less than 10 °C temperature rise). -40 °C to +85 °C, storage.
Humidity:	Less than 95% R.H. noncondensing.
Dimensions:	197mm high, 220mm deep, 13mm wide. (7.5" x 8.66" x 0.5").
Dimensions, Shipping:	When ordered with a 53/63 Card Cage, the card is installed in one of the card cage function card slots. When ordered alone, the shipping dimensions are: 254mm x 254mm x 127mm. (10" x 10" x 5").
Weight:	0.46 kg. (1.0 lbs).

Weight, Shipping:	When ordered with a 53/63 Card Cage, the card is installed in one of the card cage function card slots. When ordered alone, the shipping weight is: 0.92 kg. (2.0 lbs).
Mounting Position:	Any orientation.
Mounting Location:	Installs in any function-card slot of the 53/63 Series Card Cage.
Input Connection:	A 48-pin card-edge hooded connector (53A-780) or the 53A-720 Analog Cable provides a connection for all analog signal inputs and common outputs.
Output Connection:	The analog output is connected through either the 48-pin front-edge connector of the 53A-333 Card or the analog output connector on the 53A-002 or 63A-012 Card Cage backplane.
Required Equipment (Not Supplied):	53A-780 Hooded Connector or the 53A-720 Analog Cable.
Equipment Supplied:	53A-333 Reed Relay Scanner Card. Spare Fuse (Part #42202-52001). Operating Manual (Part #00000-13330). Service Manual (Part #00000-23330).

OPERATION

Overview

The 53A-333 Reed Relay Scanner Card is programmed by ASCII characters issued from the system controller to the 53/63 System's communications card. The 53A-333 Card is interfaced to the communications card through the 53 Series or 63 Series Card Cage's backplane.

When a command is issued to close a channel on the 53A-333 Card, all channels on all scanner cards (53A-331, 53A-332, 53A-333, 53A-334, and 53A-336) are automatically opened. This feature prevents accidentally connecting more than one set of scanner input lines to the common outputs lines at the same time. Once a channel is closed, it stays closed until another channel is closed; on each card, only one channel may be closed at a time. If the user does not want all channels to automatically open when a channel on another scanner card is closed, then the Scan Clear switch defined in the Description section should be set to position C2.

To address the 53A-333 Card for the first time, the system command "@XY" must be sent. "X" is the mainframe address (0-9); "Y" is the card-slot address (0-9) within that mainframe. Once the 53A-333 Card is addressed, it stays addressed until the system receives a new "@XY" command with a new "XY". Appendix A fully discusses the "@XY" command and the other 53/63 System commands. After the 53A-333 Card is addressed, the commands listed below may be issued until another function card is addressed.

Card Commands

Detailed descriptions of the 53A-333 Card's commands are as follows:

Command	Description
Z_1Z_2	The Z_1Z_2 command connects the three input lines of a channel to the three common output lines.
	Z_1Z_2 is a 2-digit decimal integer that represents the channel number (00-14) to be closed. When closing channels 00 to 09, the "0" character(s) may be optionally replaced by ASCII space characters, but the leading "0" or space character may not be omitted.
	Example: The command @0205 opens any closed channel and then closes channel 5 of the scanner card at card-slot 2, mainframe 0.
	Status: Power LED is out. Channel LEDs "0X" and "5" are lit; all others are out.

R

The R command resets (opens) all channels of a given scanner card.

Example: The command @02R opens all channels on the 53A-333 Card in card-slot 2, mainframe 0.

Status:
Power LED is out.
Channel LEDs are out.

Input Request

An input request to the 53A-333 Card lets the user interrogate the card to find out which channel, if any, is closed. When the 53A-333 Card is addressed (power LED out) and the system controller requests input from the 53/63 System, the card returns a 2-digit number followed by <CR><LF>. The number returned corresponds to the closed channel (00-14). If no channels are closed, "20" is returned. If the card malfunctions, "30" is returned. The readback feature uses a fourth pole on each relay to detect a closed channel, providing a self test of the complete card, including the relay coil.

INSTALLATION

The 53A-333 Card is a function card; therefore, it may be plugged into any blue card slot. Setting the Address Select switch defines the card's programming address. To avoid confusion, it is recommended that the slot number and the programming address be the same.

CAUTION:

To avoid plugging the card in backwards, observe the following:

a. Match the keyed slot on the card to the key in the backplane connector. The component side should be to the right for a 53 Series Chassis and to the top for a 63 Series Chassis.

b. There are two ejectors on the card. Make sure the ejector marked "53A-333" is at the top for a 53 Series Chassis and to the left for a 63 Series Chassis.

CAUTION:

The 53A-333 Card is a piece of electronic equipment and therefore has some susceptibility to electrostatic damage (ESD). ESD precautions must be taken whenever the module is handled.

APPENDIX A

53/63 SYSTEM COMMANDS

Command	Description
@XY	The "@XY" command addresses a function card in the 53/63 System. The "@" is a delimiter used by the 53/63 System. The "X" is a mainframe address (0-9) defined by the Address Select Switch on the 53A-171 Control Card in that mainframe; the "Y" is a function-card address (0-9) defined by the Address Select Switch on the function card. Once a mainframe and function card combination is addressed, it remains addressed until the 53/63 System detects a new "@" character.
@XH	The "@XH" (Halt) command halts all function cards within the mainframe defined by "X". The command does not affect function cards in other mainframes. If the 53A-333 Card is addressed (Power LED out) when a "@XH" command is received, the card will become unaddressed (Power LED lit).
STOP	The STOP command is not a string of ASCII characters. The command is hard-wired from the system controller (calculator or computer) to the 53/63 System communications card in each mainframe. When the system controller issues a STOP command, each function card, including the 53A-333 Card, reacts as if it received the "@XH" command described above. How the system controller executes the STOP command depends on the communications card used. With the 53A-128 IEEE-488 Card, for example, a STOP command is executed when the system controller asserts the IEEE-488 bus line IFC (Interface Clear) true.

APPENDIX B

PIN ASSIGNMENTS FOR THE FRONT-EDGE CONNECTOR

Pin No.	Description	Pin No.	Description
A	Channel 0 High	1	Channel 1 High
B	Channel 0 Low	2	Channel 1 Low
C	Channel 0 Guard	3	Channel 1 Guard
D	Channel 2 High	4	Channel 3 High
E	Channel 2 Low	5	Channel 3 Low
F	Channel 2 Guard	6	Channel 3 Guard
H	Channel 4 High	7	Channel 5 High
J	Channel 4 Low	8	Channel 5 Low
K	Channel 4 Guard	9	Channel 5 Guard
L	Channel 6 High	10	Channel 7 High
M	Channel 6 Low	11	Channel 7 Low
N	Channel 6 Guard	12	Channel 7 Guard
P	Channel 8 High	13	Channel 9 High
R	Channel 8 Low	14	Channel 9 Low
S	Channel 8 Guard	15	Channel 9 Guard
T	Channel 10 High	16	Channel 11 High
U	Channel 10 Low	17	Channel 11 Low
V	Channel 10 Guard	18	Channel 11 Guard
W	Channel 12 High	19	Channel 13 High
X	Channel 12 Low	20	Channel 13 Low
Y	Channel 12 Guard	21	Channel 13 Guard
Z	Channel 14 High	22	Common High
AA	Channel 14 Low	23	Common Low
BB	Channel 14 Guard	24	Common Guard

APPENDIX C

HIGH VOLTAGE SWITCHING WITH THE 53A-333

Because a scanning system has multiple sources that can be switched to a common bus, with each source having system-dependent amounts of capacitance, several considerations besides the 200V rating of the relay contacts affect the level of voltage that can actually be switched.

The first, and most serious, problem is caused by high voltage switching into a capacitive bus. The severity of the problem depends on current and heat limitations of the relay. The contacts on the 53A-333 are rated at 10W and 0.5 amp. Even though the currents appear to be very low in a high impedance measurement application, the bus capacitance causes extremely large inrush currents which may be enough to seriously damage or degrade the reliability of the relay contacts.

It is not easy to determine analytically the amount of voltage and capacitance that will cause enough inrush current to degrade the contacts. Tek/CDS has found the following approximation to work, though:

> The voltage times the capacitance should not exceed 10^{-8} volt-farads for a 10W contact.

(40V into a 250 pF bus, for example.) If this value is exceeded, the 53A-336 (which has a contact rating of 150W) may be used, or resistors may be placed between the scanner card common and the bus. On the 53A-333, if the backplane analog bus is used, the resistors may be installed in place of a 3-position switch on the card (consult the factory). If the front connector is used for the scanner bus, the resistors need to be installed in the mating connector to the 53A-332. A resistor of 20 to 200 Ohms is typically used, depending on how much series resistance can be tolerated in the application. Consult the factory for installation or resistor selection assistance.

The second problem is that the previous switched voltage may still be present on the common bus (due to the bus capacitance). A situation could occur where the previous voltage is -200V (DC or instantaneous AC) and the new voltage is +200V, placing 400V across the relay contacts and exceeding their 200V rating. This problem may be relieved by placing discharge resistors on each leg of the bus. The 53A-333 provides 1 Mohm resistors on-card that can be activated with a Bus Resistance switch (see the Controls and Indicators sub-section). When multiple scanner cards are used, the resistances on one or multiple cards may be used.

The use of these resistors needs to take into consideration the required measurement impedance of the application and whether the time constant of the resistance with the bus capacitance is sufficient to discharge the voltage to the required level within the switching time of the scanning card. The bus capacitance depends on the amount of cabling. The typical capacitance of a Tek/CDS 53A-715 Cable, for example, is 15 pF per foot. The minimum time between release of one voltage and contact closure for the next voltage on a 53A-333 is 3.0 msec. (See below for an example analysis.)

The scanning time can be lengthened by switching in an unused scanning channel between the two switched voltages. A time delay in the program will have no effect. Tek/CDS scanning

modules automatically release the previous relay a fixed time prior to the closing of a new channel to automatically preclude two scanner sources being shorted.

The third consideration is the maximum contact breakdown of 250V DC or 1000V RMS. In DC applications particularly, the maximum difference between any two DC sources is, as a result, limited to 250V DC.

Example:

Input voltage on 2 successive 53A-333 channels	= 165V DC first channel; -165V DC second channel
Backplane analog bus capacitance	= 2000 pF
Backplane analog bus impedance	= 1 megohm
Residual voltage after 3.0 ms	= VR

$$VR = V \times e^{-(t/RC)}$$
$$= 165 \times e^{-(.003 / 1 \times 10^6 \times 2000 \times 10^{-12})}$$
$$= 37.0$$

For this example, the next channel to be closed is at -165V. Therefore, the voltage across the relay contacts could be 37 - (-165), or 202.0V. Since 202.0V is more than 200V (the switching voltage of the 53A-333 Card), an unused channel should be closed between the closure of the two channels.
