LOAD BOARD

DESCRIPTION

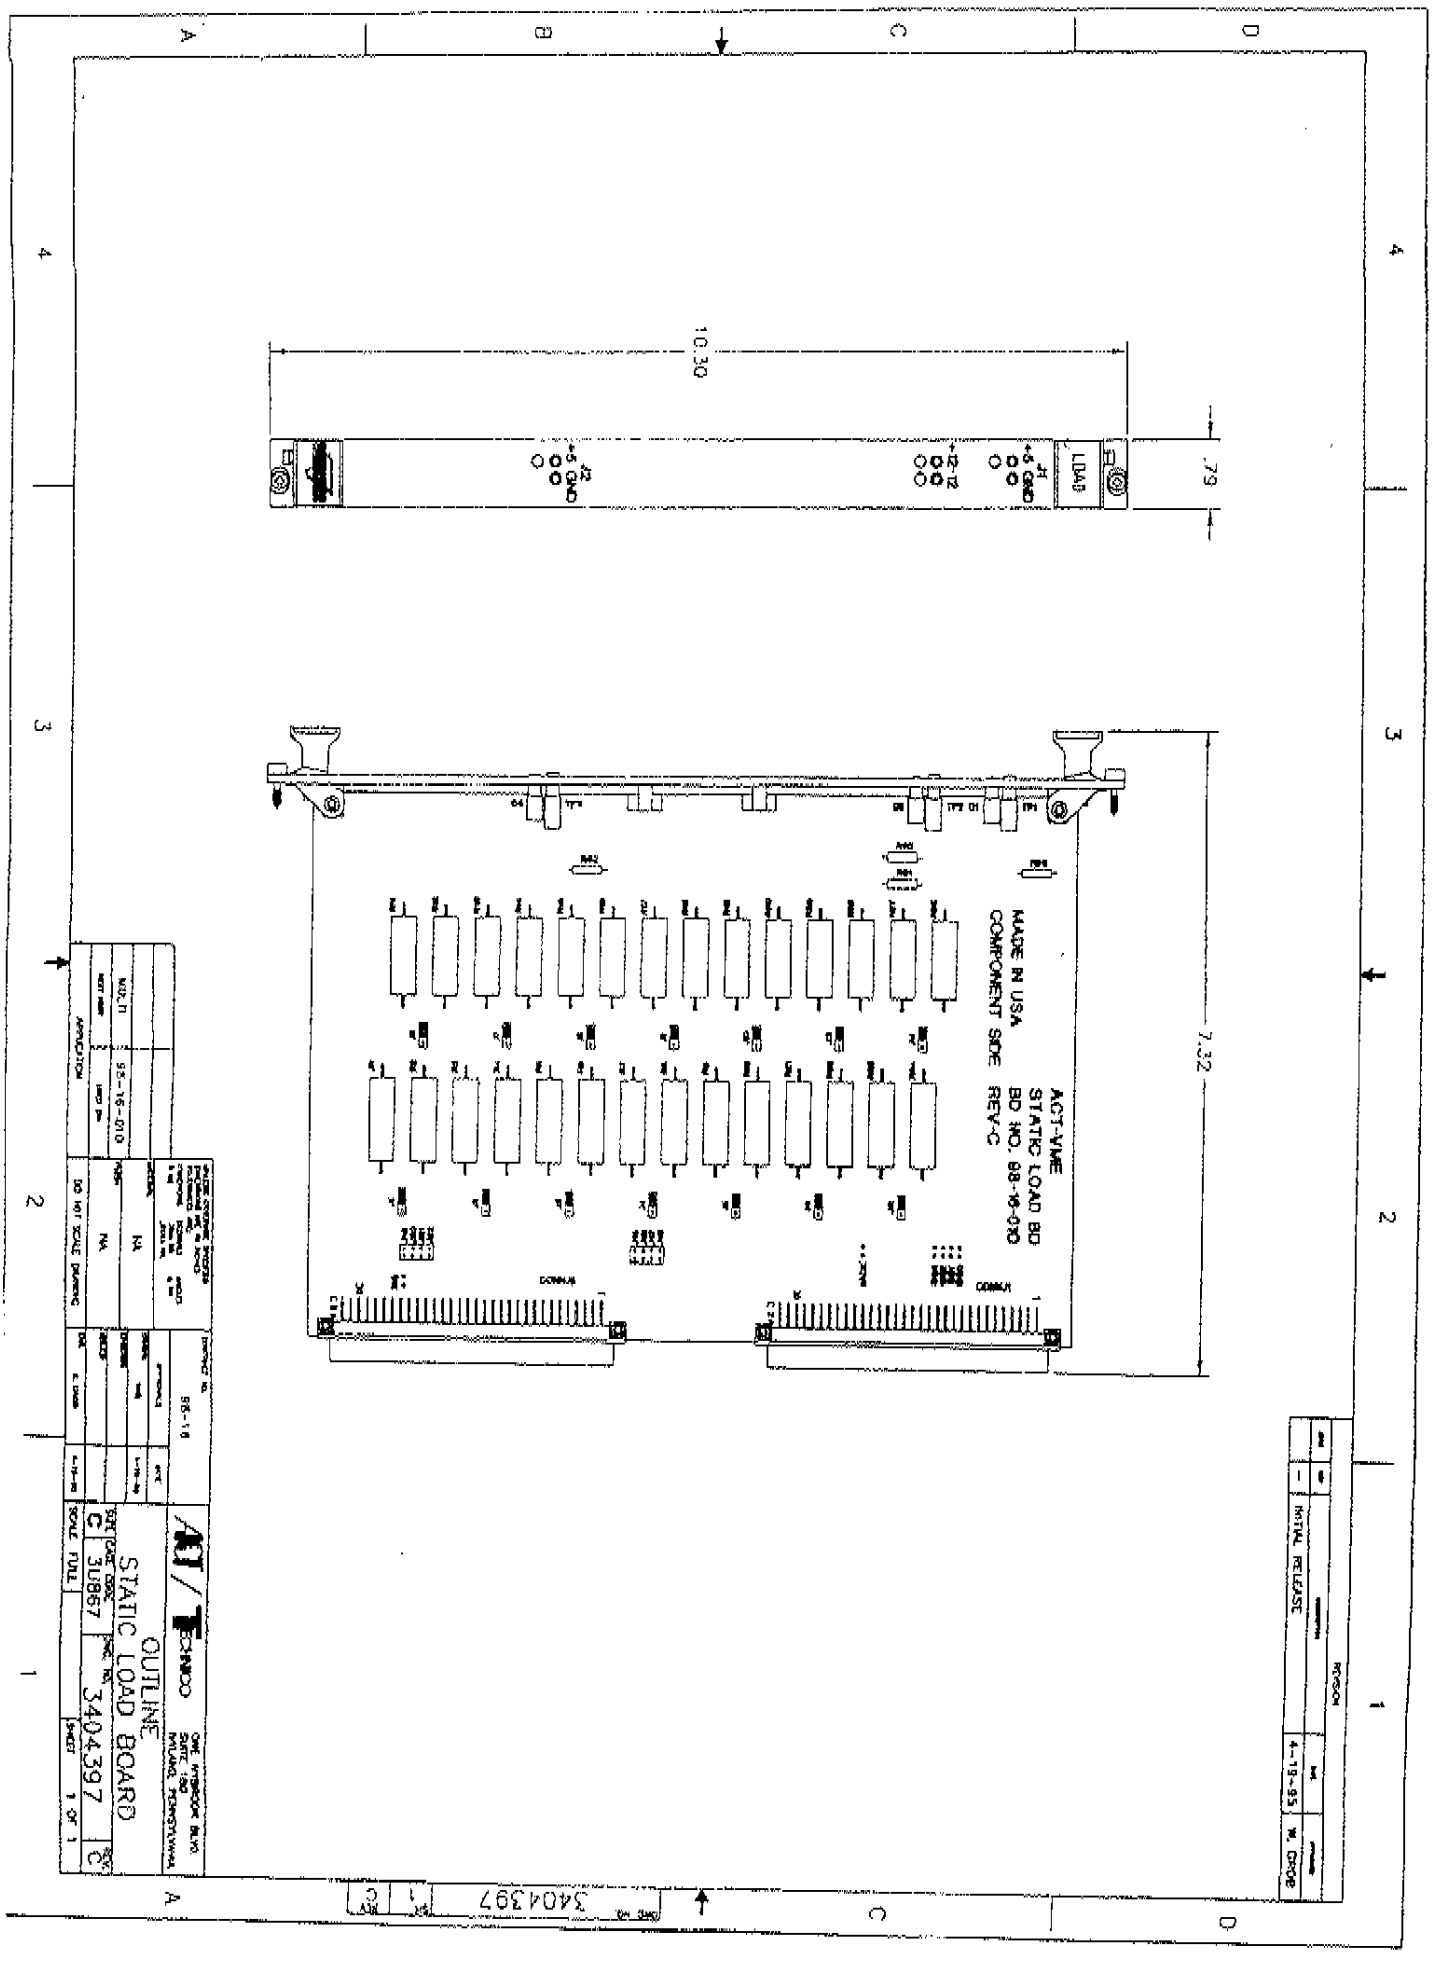

The load board is designed to provide a 50 watt maximum load on the five volt supply of the system under test. The load board will also provide a 24 watt load on the plus and minus twelve supplies. The load board is designed to test the VMEbus backplane, interconnections, wiring, and power supply system.

The load board is an economical way to fully load a VME Bus backplane and power supply, without using the actual VME bus hardware.

FEATURES

- Provides a nominal 50 watt load on the five volt supply
- Load current is selectable in 1 amp current increments via jumpers
- Loads plus and minus 12V, jumper selectable
- Board uses 28 load resistors that are evenly distributed over the board, thus distributing the power to be dissipated over the entire board area
- Provides test points for measuring the supply voltages from the front panel
