Vibration Analysis... Adding Value to Every Business
Lost production due to machinery failure and the resulting costly, unbudgeted repairs can have a serious effect on profitability. Leading manufacturing and industrial service companies the world over are turning in increasing numbers to proactive maintenance systems and their associated technologies to keep their equipment in production between planned maintenance periods - maximising throughput, maximising labour efficiency, and maximising profits, Proactive maintenance is being adopted as 'best practice' and becoming a crucial part of integrated production management systems.

Proactive maintenance allows for accurate prediction of potentially disastrous failures and their cure in time, Machinery condition is monitored on a regular basis, ensuring that problems are readily detectable and can be evaluated whilst the equipment is still running.

Vibration analysis, suitable for virtually all rotating equipment, is the single most effective element of a proactive maintenance system, and is now available and accessible to a wider range of users than ever before.

The VB Series - available, accessible, affordable

Vibration Analysis, as an integral part of a proactive maintenance program, helps your team shift from reacting to
