Model Aurora 14 6 Channel 1 MHz Transient Recorder

The Aurora 14 Transient Recorder is fully self contained analog waveform digitizer capable of simultaneous sampling of data on six separate channels all at rates up to 1 MHz. Housed in a single width CAMAC module, each channel contains a separate differential amplifier, sample/hold, 12 bit Analog to Digital Converter, and up to 1024K word memory. With a separate A to D converter per channel, no analog multiplexer is required, resulting in excellent reduction of crosstalk between channels. Overloading of one channel has a negligible effect on other channels.
