# Coaxial Matrix Card

## 8x12

The Model 7073 Coaxial Matrix Card provides fully shielded signal lines for excellent noise rejection in test systems. Isolation jumpers on the card can be removed to disconnect the card signal paths from the coaxial analog backplane, and the shield provides >80dB isolation at 1MHz between signal paths to minimize crosstalk and coupling of adjacent signals. The 30MHz bandwidth and the 50 $\Omega$  characteristic impedance minimize distortion and overshoot in high frequency and digital signals. Contact potential for the Model 7073 is specified at <2 $\mu$ V, which is useful when measuring sensitive voltage signals. The card can also switch voltages up to 200V. Current capacity of the matrix card is 1A for switching moderate power to test devices and circuits.

# General Purpose Multiplexer

## Eight 1x12, Dry Reed

The Model 7074-D consists of eight banks of independent 1x12 multiplexer switching. Each bank has three switched circuits (HI, LO, GUARD) and is connected through jumpers on the switching card to one of eight general-purpose signal paths, which provide automatic interconnect between switching cards. Jumpers can be removed to isolate any bank of switching or repositioned to cascade banks into longer switching configurations (1x24, 1x36, dual 1x48, 1x96, etc.) or banks can be connected in a tree configuration for improved isolation.
