Functional Description

The PCIP-PPS is a programmable triple-output power supply that plugs into any IBM PC/XT/AT or compatible computer. It provides all the features and functions you expect from a conventional programmable power supply. It uses, however, the computer's monitor for display and the keyboard/mouse or user program for control. In manual mode, the display operates as a Pop Up Control Panel when a user-selected key sequence is activated. In program mode, the PCIP-PPS can be controlled through a program using simple English commands. The included DOS file I/O device driver allows flexibility for programming in virtually any language.

The PCIP-PPS can simultaneously output three dynamically programmable voltages. Full four-quadrant operation is possible on the bipolar 15 volt supplies. A built-in 3½-digit DMM measures DC voltage, DC current, and resistance. It allows easy verification of output levels as well as providing a simple method to monitor power levels and voltage drops in cables. Connections can be made to the PCIP-PPS through a supplied 26-pin cable and external box or through a user-designed cable.
