OPTION 010

20 Channel Relay Multiplexer Assembly

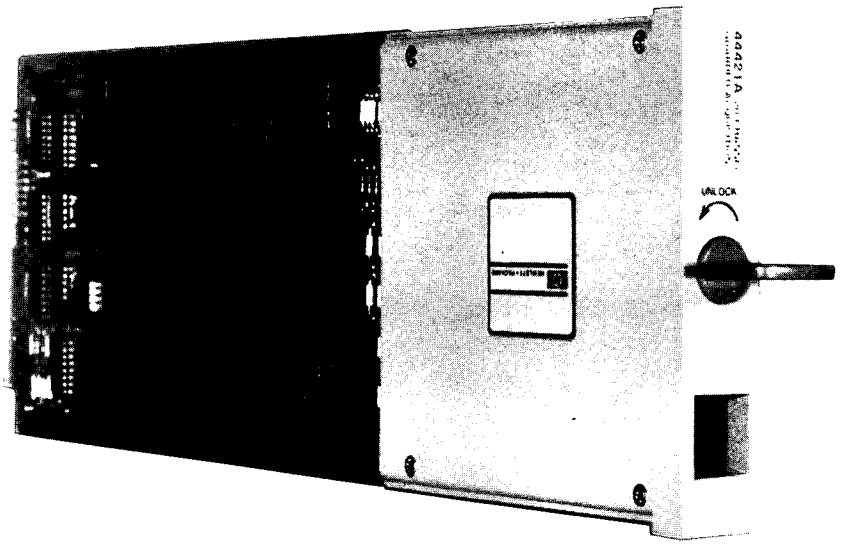

Description

Option 010 is a 20 channel analog signal multiplexer assembly which is used to switch (multiplex) signals from up to 20 channels to the 3497A DVM or to other assemblies or instruments.

Each of the 20 channels consists of three relays, one each for High, Low and Guard lines. The channels are organized into two groups of 10 channels and one channel can be closed in each decade. In addition, relays can be closed in a random fashion or can be incremented between programmable limits.

Applications

Because the 20 Channel Relay Multiplexer has low thermal offset characteristics, this option is ideal for precise low-level measurements of transducers and temperature measuring devices. Since two channels (one per decade) can be closed at a time, one Option 010 assembly can be used to make four-terminal resistance measurements.
