MAC 2000 Modular Automation Controller

Many analytical techniques in industry, in the laboratory, and in biological research require control and data acquisition systems which are tailored to a specific need or application. Up to now, a number of different instruments were necessary to cover a multitude of applications, resulting in unnecessary duplication of basic components such as power supplies, computer interfaces, motor controllers, etc.

The **LEP MAC 2000** Modular Automation Controller has been designed to eliminate this type of duplication. Up to 255 individual modules are controlled by one bus. Each module incorporates its own operating firmware and address which minimizes and thereby simplifies interaction with a computer. Any external computer can be interfaced via Standard RS-232.

With the specific Programming/CPU module, the **MAC 2000** becomes a dedicated instrument, such as an X-Y stage controller, with full access to all of its capabilities from a keypad.

The **MAC 2000** can easily be expanded to fulfill future requirements, making it the most cost-efficient system of its kind.
