TRANSITION MODULES

As the functional density of CompactPCI modules increases, so does the need for I/O connectivity. Front panel space is typically limited to two or three key I/O options such as Ethernet, USB and a PMC site. Transition modules extend the functionality of CompactPCI modules by allowing a full complement of I/O to be accessed from the rear of the CompactPCI chassis. This method provides for ease of serviceability since field wiring does not need to be removed in order to exchange a CompactPCI board. Transition modules can also be used to add storage options such as CompactFlash. Motorola provides a complete line of transition modules to complement and add functionality to our CompactPCI products.
