For added convenience and versatility, OMEGA is introducing the OMEGAMARKER® temperature test kits for those who must measure many different temperatures. Each kit includes 10 individual temperature-sensitive crayons plus a holder for each crayon and a crayon sharpener, all in a self-contained case.

The crayons indicate temperatures from 52 to 399°C (125 to 750°F) and are accurate to within ±1%. Each crayon is 63 mm (2½") long.

The OMEGAMARKER® crayon is easy to use, but certain conditions must be considered. OMEGAMARKERS will not make any mark on smooth or rough surfaces in cold conditions. When rubbed hard on a rough surface, the OMEGAMARKER® gets ground and the powder is deposited on the surface which appears like a mark, but will not adhere. The correct way of using OMEGAMARKERS would be to strike it across a pre-heated surface during the heating process, using proper safety precautions. While the temperature is below the rated temperature there will not be a visible mark, but as soon as the surface reaches the rated temperature of the marker, at the point of contact the marker will melt and make a visible mark on the surface. This is an indication that the surface has reached the rated temperature of the OMEGAMARKER®.

Typical applications include lab use, forging, heat treating and fabrication of metals, molding of rubber and plastics, and general purpose use on any accessible heated surface.
