800 kSa/s, 2- and 4-channel Digitizers

Overview

The VXI Technology VT1563A and VT1564A digitizers are C-size, single slot, register-based VXI modules. They are ideal for measurements in electronic production test and electromechanical design characterization, particularly in environments with high levels of electrical noise. Engineers and technicians in manufacturing test, product development, and engineering research test groups can fully characterize electronic and mechanical transient waveforms with these highly accurate digitizers.

Each channel of the digitizers has its own analog electronics, including 800 kSample/s 14-bit A/D converters and independent channel isolation. The VT1563A channels have switchable 25 kHz input filters and the VT1564A channels have four (4) selectable input filters.

The digitizers are configured for PC SIMM memory, scaleable from 4 MB to 128 MB. The large memory can easily capture transients and act as a FIFO to allow continuous digitizing while unloading data with block mode transfers.

Time Base and Triggering

All channels sample simultaneously with a single internal or external time base. Triggering can be set up for either time or event modes with programmable pre- and post-trigger reading counts

Programming

The VT1563A and VT1564A both have a simple programming model which includes a data FIFO or flat file memory model for the A/D converter, 16-bit integer data corrected for offset and gain errors, and a current value table to retrieve the current sample of data.

Calibration

The VT1564A provides a calibration source with flash ROM for holding calibration constants.

Refer to the VXI Technology Website for instrument driver availability and downloading instructions, as well as for recent product updates, if applicable.
