Measurement Methodology

- Compliant jitter measurements acquired with a known pattern and pattern marker
 - AG-100 matches to the 40 bit SOF
 - Pattern marker produced after the SOF
 - Pattern marker used as an “arm” DTS
- System components are a DTS 2077 Communication Signal Analyzer, VISI 6.0 dataCOM software, system controller and the new AG-100 Arm Generator

How is the FC/GBE Jitter Measurement Performed?

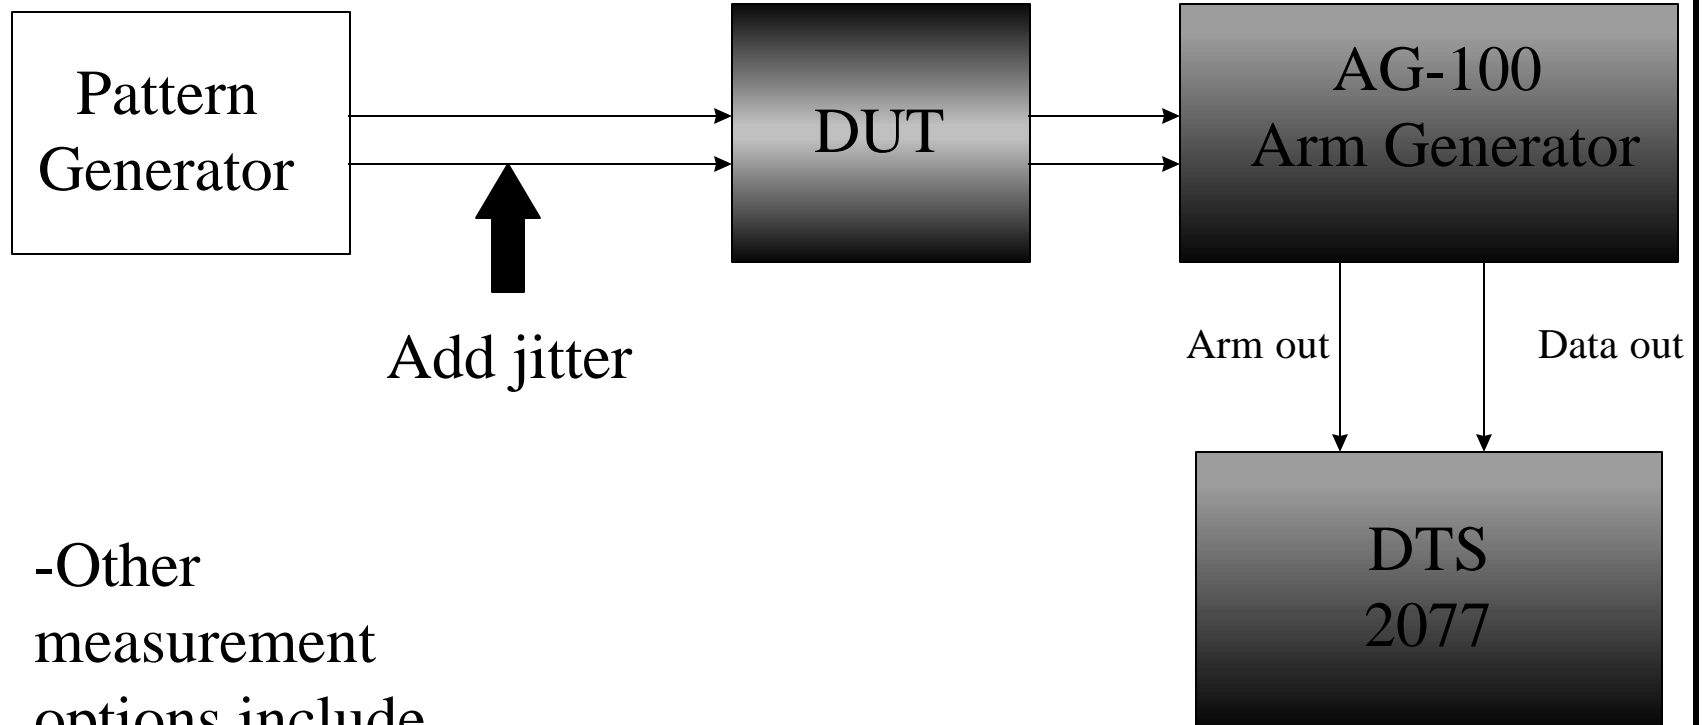

AG-100 matches to SOF → “ARM” marker produced ~140 cycles after pattern match → Data acquired after “arm” marker
